# **Proof of performance for**

## **WMPA 93.1 FM**

The purpose of this report is to establish that the operation authorized in this construction permit is in compliance with the spurious emissions requirements of 47 C.F.R. Sections 73.317 (b) Any emission appearing on a frequency removed from the carrier by between 120 kHz and 240 kHz inclusive must be attenuated at least 25 dB below the level of the unmodulated carrier. Compliance with this requirement will be deemed to show the occupied bandwidth to be 240 kHz or less. (c) Any emission appearing on a frequency removed from the carrier by more than 240 kHz and up to and including 600 kHz must be attenuated at least 35 dB below the level of the unmodulated carrier. (d) Any emission appearing on a frequency removed from the carrier by more than 600 kHz must be attenuated at least  $43 + 10 \text{ Log}_{10}(\text{Power, in watts})$  dB below the level of the unmodulated carrier, or 80 dB, whichever is the lesser attenuation. All measurements were made with all stations simultaneously utilizing the shared antenna system. A Anritsu MS2721A Spectrum Analyzer which has a calibration certification as of 05/21/2012 was used in all measurements. The following analyzer displays demonstrate compliance with 73.317 FM transmission system requirements. All measurements in this report are true and completed to the best of my ability.
