### **WSRY STA Extension Progress Report**

It has been a financial struggle keeping up with the repairs needed to keep the ground system at all 3 towers working to it's fullest at WSRY. Consequently, we are still operating at reduced power as the Harris Gates-One transmitter is still folding back with high VSWR. Current output power is 35 watts as of January 26, 2022. Monitor point measurements continue to show that we are well within our licensed operating parameters.

We are now working on getting a study made by Communications Technologies Inc. for what it would take to get optimal coverage with a non-directional antenna system for WSRY. Preliminary findings are that we could go Non-directional with 250 watts daytime and 4 watts at night. We can file this application protecting the CP of WNWR 1540 Philadelphia with the condition that WSRY does not file it's ND license until WNWR has filed their 10kw license application. This would allow us to remove 2 of the 3 towers at the site and reduce the problematic underground wiring by two-thirds.

We are hoping that the study comes back positive so that we can move on from the current directional system.
