

KIQX Radio
Durango, CO

File #BMPH-20050404AAC

EXHIBIT #

(To comply with special operating condition #3)

Radio stations KIQX and KRSJ share a common antenna. RF measurements taken in the vicinity of the tower to be within FCC-adopted guidelines for public RF exposure (20 volts per meter). At the immediate base of the tower the RF exposure is within the professional/employee exposure guidelines (60 volts per meter). These measurements were taken in November of 2006 using an FIM-71 field strength meter.

The site is in rugged terrain, approximately four miles behind a closed and locked gate, with access allowed to only people with knowledge of radiofrequency energy. Additionally, there are RF Exposure warning signs posted at the tower base and on the transmitter building, reminding any workers at the site of the RF potential exposure to electromagnetic fields.

Whenever work is performed by the licensee or its tenants on the tower, strict licensee-required rules require reduction of transmitter power.
