

RFR EXHIBIT Formula Subpart

RADIATION HAZARD FORMULA  
W260AY-W259BA  
Harvey's Lake/Dallas

This proposal has been evaluated with respect to the RF  
radiation exposure guidelines contained in OET Bulletin 65.

For the FM band, the power density may be computed from the formula:

$$S = \frac{(33.4)(F)(F)(P)}{(R)(R)}$$

where: S = Power Density

P = Total power in watts (Horizontal + Vertical)

R = Height of center of radiation in  
meters above ground minus 2

F = Relative field factor in the downward direction of  
interest (-60 to -90 degrees elevation) as supplied  
by the antenna manufacturer.

The antenna model is: Scala CA-2V Vertical

In this case P = 132 and R = 6 and F = 0.345

FCC General Population/

Uncontrolled Exposure limits permit up to 0.2 mW/sq cm exposure

at this frequency. Therefore at ground level, S = 0.0145766

mW/sq cm, or: 7.29% of the allowable.

It is evident that no practical hazard should exist.
