

TECHNICAL EXHIBIT  
APPLICATION FOR AUXILIARY STATION CONSTRUCTION PERMIT  
STATION WXXJ(FM)  
JACKSONVILLE, FLORIDA  
CH 275C 23 KW 171 M

Technical Narrative

The technical exhibit of which this narrative is part was prepared on behalf of radio station WXXJ(FM) at Jacksonville, Florida. The WXXJ(FM) main facility is presently licensed on Channel 275C with an effective radiated power of 100 kilowatts employing a non-directional antenna and antenna height above average terrain of 309 meters.<sup>1</sup> By this instant application, WXXJ(FM) is proposing a new auxiliary (stand-by) construction permit authorization. The proposed auxiliary transmitter site is located immediately adjacent to the main transmitter site. Several FM stations, including WFYV-FM and WJGL(FM), will employ this auxiliary transmitter site and common master FM antenna.

Transmitter Location

The proposed auxiliary site location is uniquely described by the following NAD-27 coordinates:

30° 16' 34" North Latitude  
81° 33' 51" West Longitude

A sketch showing the antenna and supporting structure is shown on Figure 1. It is proposed to operate with an effective radiated power of 23 kilowatts.

Coverage Contours

The predicted 60 dBu coverage contours for the auxiliary operation and the existing main operation were calculated in accordance with the provisions of Section 73.313. In accordance with current FCC practice, the distances to the contours were calculated without consideration given to terrain roughness correction factors.

The average terrain elevations from 3 to 16 kilometers along eight radials evenly spaced at 45 degree intervals were obtained from the National Geophysical Data Center's (NGDC) 30-second terrain database. The terrain elevations were then used in combination with the effective radiated power for determining the distances to coverage contours.

Figure 2 is a map showing the predicted 60 dBu coverage contours for the licensed and proposed operations. As the map illustrates, the predicted auxiliary's 60-dBu contour is entirely encompassed by the primary station's 60-dBu contour.

Radiofrequency Electromagnetic Field Considerations

The proposed WXXJ(FM) auxiliary facility was evaluated in terms of potential radiofrequency electromagnetic field exposure at ground level to workers and the general public. The radiation center for the proposed WXXJ(FM) auxiliary antenna is located 168 meters (550 feet) above ground level. The maximum effective radiated power is 23 kilowatts. A Dielectric antenna, model number DCRM6C with six sections and 0.5 wavelength spacing will be employed. Using the Commission's *FM Model* prediction computer program, The calculated power density at a point 2 meters above ground level would not exceed  $8 \mu\text{W}/\text{cm}^2$ . This is less than 5 percent of the Commission's recommended limit of  $0.2 \text{ mW}/\text{cm}^2$  for an FM station.

Access to the transmitting site is restricted and appropriately marked with warning signs. As this is a multi-user site an agreement between the stations will control access. In the event that workers or other authorized personnel enter restricted areas or climb the tower, appropriate measures will be taken to assure worker safety with respect to radio frequency radiation exposure. Such measures include reducing the average exposure by spreading out the work over a longer period of time, wearing "accepted" RFR protective clothing and/or RFR exposure monitors or scheduling work when the stations are at reduced power or shut down. The proposed operation appears to be otherwise categorically excluded from environmental processing.

It is noted that this statement only addresses the potential for radiofrequency electromagnetic field exposure. All other aspects of the environmental processing analysis will be or already have been provided to the FCC by the tower owner.
