

Illinois Bible Institute, Inc proposes to correct its transmitter coordinates by 3 degrees of latitude and correct the base elevation from 354 meters to 352 meters AMSL. The antenna center of radiation above ground will remain the same.

Old Coordinates: N. Lat 40 09 09, W. Lng. 88 06 56

New Coordinates: N. Lat 40 09 12, W. Lng 88 06 56

This correction causes no new contour overlaps. There is, however, one contour overlap that WBGL causes that exists under the current licensed coordinates, with WFWR, Attica, Indiana.

The combination of the proposed coordinate correction and corrected base elevation results in an overlap with WFWR that is slightly smaller in size. Therefore, the instant proposal does not exacerbate the size of the overlap predicted using the previously licensed parameters.

Page #2 of this exhibit, the single channel contour-to-contour study that follows this page, shows no direct-line overlap, either incoming or out going. Page # 3 is a similar study using the existing WBGL coordinates. (Page #4 is a narrative on how to read the channel-study table.) However, both the existing and the corrected coordinates instant proposal have contour overlap at azimuths off the direct-line. The map shown on page #5 of this exhibit shows the proposed overlap, while the FMOver study, pages #6 through #11, that follows shows a tabulation of the contour overlap in dB. The map on page #12 shows the existing overlap, while the FMOver tables #13- #18 show the existing overlap in dB using the FMOver format.

The reader will note that both the corrected coordinates map and the FMOver tables show that the existing overlap is slightly reduced under the instant proposal.

WBGL meets all Section 73.207 minimum spacings with regard to commercial stations, construction permits and allocations.

**Channel-Six TV Protection:**

With regard to protection to channel-six TV, the page #2 channel-study table shows that there are no channel-six TV stations within the cutoff distance for channel 219 of 159 kilometers.

"\*affixed to 'IN' or 'Out' values = site inside protected contour.

"<" = station meets FCC minimum distance spacing for its class. "<" = contour overlap

## HOW TO READ THE FM COMPUTER PRINT-OUT

The computer printout should be self-explanatory for the most part. The parameters of the station being checked, (reference station) are printed in the heading. The 60 dBu protected contour is predicted from the Commission's F(50-50) table, while the 40, 54, 80 and 100 dBu contours are interference contours derived from the Commission's F(50-10) table. Contour distances are in kilometers and are predicted using spline interpolation from data points identical to those published in Report No. RS 76-01 by Gary C. Kalagian. Critical contour distances are determined using the Commission's TVFMINT FORTRAN subroutine. When interference contour distances are less than 16 kilometers the F(50-50) tables are used. If signal contour distances are less than 1.6 km the free-space equation is used.

The column listed "**\*\* IN \*\***" is the sum of the reference station's 60 dBu protected contour and the data file station's interference contour subtracted from the distance between the stations. (All distances are derived by the method detailed in Sec. 73.208 of the Rules and Regulations as amended in Docket 80-90.) Therefore, the column is a measure of incoming interference. Negative distances in this column indicate the presence of interference. Listed antenna heights are the average heights of eight standard radials as found in the Commission's records unless otherwise noted, in which case the specific antenna heights and the DA power, if applicable, along the straight line azimuths between the reference station and the database station are used and visa versa. The column labeled "**\* OUT \***" shows the distance in kilometers of overlap or clearance between the reference station's interference contour and the database station's protected contour. Negative distance figures in this column indicate outgoing overlap interference.

Under the "AZIMUTH" column, the first row of numbers indicate the bearings from True North of the data base stations in relationship with the reference station, while the numbers in the second row indicate the reverse bearings from the database station to the reference station.

The columns labeled "INT" and "PRO" hold the distance in kilometers of the appropriate interference contour and the protected contour of a data base station.

For I.F. relationships the "IN" and "OUT" columns change their significance. The letter "R" stands for the minimum **required** distance in kilometers, while the letter "M" in the next column follows the **available clear space** separation in kilometers. Minimum separation distances when displayed are taken from Sec 73.207 of the rules as amended. Canadian and Mexican separation distances, U/D ratios and protected contour values are from the US/Mexican Working Agreement and the US/Canada Working Agreement".

The first three letters of the "TYPE" column identify the current FCC status of the stations. The fourth letter will be a "D" if the facility is directional. "Z" indicates a 73.215 directional. An "N" indicates it is a 73.215 station that operates omni. The fifth letter will be an E, H or V depending on the type of antenna polarization. The sixth letter will be a "Y" if the antenna uses beam tilt or an "X" if the commission is not sure, otherwise it will be an "N".
