**Re: South Texas Broadcasting, Inc.  
Station KTEK(AM), Alvin, Texas (Facility ID No. 10827)**

**FCC Form 302-AM Moment Method License Application**

Dear Ms. Dortch:

Transmitted herewith in triplicate, on Form 302-AM, is a license application for Station KTEK(AM), Alvin, Texas (Facility ID No. 10827). A copy of the FCC Form 159 demonstrating payment in full of the application filing fee of \$1,365.00 is also enclosed.

Please date-stamp and return the enclosed additional copy of this application. Should you have any questions, please do not hesitate to contact the undersigned.

Very truly yours,

Davina S. Sashkin  
Counsel for South Texas Broadcasting, Inc.

3. Is the station now operating pursuant to automatic program test authority in accordance with 47 C.F.R. Section 73.1620?  Yes  No

If No, explain in an Exhibit. N/A Exhibit No.  
N/A

4. Have all the terms, conditions, and obligations set forth in the above described construction permit been fully met?  Yes  No

If No, state exceptions in an Exhibit. N/A Exhibit No.  
N/A

5. Apart from the changes already reported, has any cause or circumstance arisen since the grant of the underlying construction permit which would result in any statement or representation contained in the construction permit application to be now incorrect?  Yes  No

If Yes, explain in an Exhibit. N/A Exhibit No.  
N/A

6. Has the permittee filed its Ownership Report (FCC Form 323) or ownership certification in accordance with 47 C.F.R. Section 73.3615(b)?  Yes  No

If No, explain in an Exhibit. N/A  Does not apply  
Exhibit No.  
N/A

7. Has an adverse finding been made or an adverse final action been taken by any court or administrative body with respect to the applicant or parties to the application in a civil or criminal proceeding, brought under the provisions of any law relating to the following: any felony; mass media related antitrust or unfair competition; fraudulent statements to another governmental unit; or discrimination?  Yes  No

If the answer is Yes, attach as an Exhibit a full disclosure of the persons and matters involved, including an identification of the court or administrative body and the proceeding (by dates and file numbers), and the disposition of the litigation. Where the requisite information has been earlier disclosed in connection with another application or as required by 47 U.S.C. Section 1.65(c), the applicant need only provide: (i) an identification of that previous submission by reference to the file number in the case of an application, the call letters of the station regarding which the application or Section 1.65 information was filed, and the date of filing; and (ii) the disposition of the previously reported matter.

Exhibit No.  
N/A

8. Does the applicant, or any party to the application, have a petition on file to migrate to the expanded band (1605-1705 kHz) or a permit or license either in the existing band or expanded band that is held in combination (pursuant to the 5 year holding period allowed) with the AM facility proposed to be modified herein?

Yes  No

If Yes, provide particulars as an Exhibit.

Exhibit No.  
N/A

The APPLICANT hereby waives any claim to the use of any particular frequency or of the electromagnetic spectrum as against the regulatory power of the United States because use of the same, whether by license or otherwise, and requests and authorization in accordance with this application. (See Section 304 of the Communications Act of 1934, as amended).

The APPLICANT acknowledges that all the statements made in this application and attached exhibits are considered material representations and that all the exhibits are a material part hereof and are incorporated herein as set out in full in

**CERTIFICATION**

1. By checking Yes, the applicant certifies, that, in the case of an individual applicant, he or she is not subject to a denial of federal benefits that includes FCC benefits pursuant to Section 5301 of the Anti-Drug Abuse Act of 1988, 21 U.S.C. Section 862, or, in the case of a non-individual applicant (e.g., corporation, partnership or other unincorporated association), no party to the application is subject to a denial of federal benefits that includes FCC benefits pursuant to that section. For the definition of a "party" for these purposes, see 47 C.F.R. Section 1.2002(b).

Yes  No

2. I certify that the statements in this application are true, complete, and correct to the best of my knowledge and belief, and are made in good faith.

FCC NOTICE TO INDIVIDUALS REQUIRED BY THE PRIVACY ACT AND THE PAPERWORK REDUCTION ACT

The solicitation of personal information requested in this application is authorized by the Communications Act of 1934, as amended. The Commission will use the information provided in this form to determine whether grant of the application is in the public interest. In reaching that determination, or for law enforcement purposes, it may become necessary to refer personal information contained in this form to another government agency. In addition, all information provided in this form will be available for public inspection. If information requested on the form is not provided, the application may be returned without action having been taken upon it or its processing may be delayed while a request is made to provide the missing information. Your response is required to obtain the requested authorization.

Public reporting burden for this collection of information is estimated to average 639 hours and 53 minutes per response, including the time for reviewing instructions, searching existing data sources, gathering and maintaining the data needed, and completing and reviewing the collection of information. Comments regarding this burden estimate or any other aspect of this collection of information, including suggestions for reducing the burden, can be sent to the Federal Communications Commission, Records Management Branch, Paperwork Reduction Project (3060-0627), Washington, D. C. 20554. Do NOT send completed forms to this address.

THE FOREGOING NOTICE IS REQUIRED BY THE PRIVACY ACT OF 1974, P.L. 93-579, DECEMBER 31, 1974, 5 U.S.C. 552a(e)(3), AND THE PAPERWORK REDUCTION ACT OF 1980, P.L. 96-511, DECEMBER 11, 1980, 44 U.S.C. 3507.

**ENGINEERING STATEMENT OF CARL T. JONES, JR., P.E.  
IN SUPPORT OF AN  
APPLICATION FOR STATION LICENSE  
STATION KTEK - ALVIN, TEXAS  
1110 kHz - 2.5 kW-D, 2.5 kW-CH, DA-2  
FACILITY ID: 10827**

Applicant: South Texas Broadcasting, Inc.

I am a Consulting Engineer, president in the firm of Carl T. Jones Corporation, with offices located in Springfield, Virginia. My education and experience are a matter of record with the Federal Communications Commission. I am a Registered Professional Engineer in the Commonwealth of Virginia, Registration No. 013391.

**1.0 GENERAL**

This office has been authorized by South Texas Broadcasting, Inc. ("STB"), licensee of AM Station KTEK, to prepare this engineering statement and the associated figures and appendices in support of an Application for License. Station KTEK is licensed for operation on 1110 kilohertz at a power of 2.5 kilowatts during daytime hours and 2.5 kilowatts during critical hours using a controlled RMS. Computer modeling and sample system verification techniques, as described in Section 47 CFR 73.151(c) of the Commission's Rules and Regulations, were employed to verify performance of the directional antenna pattern for the daytime and critical hours operations. The KTEK critical hours pattern is identical to the daytime directional pattern with the exception that

the pattern RMS is controlled resulting in a lower common point current than that of the daytime directional pattern. The specific measurement and modeling techniques used in performing the proof of performance on the KTEK directional patterns are described in detail in this engineering statement. Impedance measurement data, sample system verification measurement data and model derived operating parameters are tabulated in the figures attached to this engineering statement. Finally, all pertinent computer model input and output files are contained in the attached Appendices A and B.

## **2.0 IMPEDANCE MEASUREMENTS, COMPUTER MODELING AND SAMPLE SYSTEM VERIFICATION**

The proof of performance contained herein is based on the computer modeling and sample system verification procedures described in Section 47 CFR 73.151(c) of the FCC's Rules and Regulations. The KTEK antenna array consists of six equal height, triangular, uniform cross-section, guyed towers. The face width of towers 1, 2, 3, 5, and 6 is 18 inches and the face width of tower 4 is 24 inches. The sampling system employs identical toroidal current transformers located in the output branch of each tower's ATU network. A detailed description of the impedance and sample system measurements and the computer models employed is contained below.

## **2.1 INDIVIDUAL TOWER IMPEDANCE MEASUREMENTS**

Impedance measurements were performed at the base of each tower, by the undersigned, at the ammeter switch located in the output branch of the ATU network. This location is immediately adjacent to the sampling system toroidal current transformer. The impedance measurements were performed using a Hewlett-Packard Model 4396A network analyzer; an Amplifier Research Model 5W1000 power amplifier; and a Tunwall Radio directional coupler. The impedance of each tower was measured with the other five towers open-circuited at the corresponding ammeter switch location. The measured impedances are tabulated in Figure 2.

## **2.2 INDIVIDUAL TOWER COMPUTER MODELS**

A Method of Moments (“MoM”) computer model was developed to model each element in the array using Expert MiniNEC Broadcast Professional (Version 23.0). A wire model was developed for each tower in the array that is comprised of 21 segments. To replicate the individual measured base impedances to within FCC specified tolerances, each tower’s physical height was adjusted in the MiniNEC model and series inductances were employed in a separate circuit model. The actual equivalent physical radius was used in all computer models contained in this application. Details of the modeled individual tower adjusted heights are contained in Figure 1.

The values of the lumped series inductances used in the circuit model are contained in Figure 2. A comparison of the measured individual tower impedances, the modeled individual tower impedances, and the adjusted modeled (circuit model)

individual tower impedances is also contained in Figure 2. The percentage difference between the adjusted modeled tower height and the actual physical tower height and the magnitude of the lumped series inductances that were used in the circuit models are all within the tolerances set forth in the Rules.

As demonstrated by the data contained in Figure 2, the adjusted modeled individual tower resistance and reactance for each tower is well within  $\pm 2$  ohms and  $\pm 4$  percent tolerance of the corresponding measured individual tower resistance and reactance. The text files containing all pertinent input and output data associated with the individual tower models are contained in Appendix A.

### **2.3 DIRECTIONAL ANTENNA COMPUTER MODEL AND ANTENNA MONITOR PARAMETERS**

The KTEK daytime directional antenna theoretical field parameters and the licensed tower spacings and orientations were used in combination with the adjusted individual tower models to produce the directional antenna computer model. Because the critical hours directional pattern is the same as the daytime directional pattern, with the exception of the common point current, a separate model was not developed for the critical hours operation. From the directional computer model, tower currents were derived for each wire segment of each antenna. Each segment current was multiplied by the segment length and numerically integrated and normalized to the appropriate reference tower to verify that the modeled current moments are essentially identical to the authorized relative directional field parameters.

The new operating parameters were determined from the modeled base currents and are tabulated in Figure 3. The text files containing all pertinent input and output data associated with the directional antenna computer model are contained in Appendix B.

#### **2.4 SAMPLE SYSTEM DESCRIPTION AND VERIFICATION MEASUREMENTS**

The KTEK antenna sampling is comprised of: 1) Delta Electronics, Model TCT-3, toroidal current transformers mounted in an identical manner in the ATU network output branch for each tower; 2) approximate equal lengths of Cablewave Systems, Type FCC 38-50J, 3/8-inch, foam dielectric, coaxial cable between each toroidal current transformer and the transmitter building; 3) short unequal length jumper cables of Andrew Corporation, Type FSJ4-50B, 1/2-inch, superflex, foam dielectric, coaxial cable between the Cablewave Systems sample cables and the antenna monitor; and 4) a Potomac Instruments Model 1901-6 antenna monitor. Each sample line between the ATU building and the transmitter building, including excess lengths, is buried; therefore, each sample line is subjected to the same environmental conditions.

Initial measurement of the sample line lengths indicated that the line lengths had a variation of approximately 2.3 electrical degrees at 1110 kHz. Therefore, short jumpers of Andrew superflex line, ranging in length from 3-2/3 feet to 6-1/4 feet, were fabricated and inserted between the sample lines entering the transmitter building and the antenna monitor. The length of each jumper was specifically cut so the lengths of

the sample lines including the length of the jumper cables were within 1 electrical degree at 1110 kHz.

The sample lines, including the superflex jumper cables, were verified to be equal in length by measuring the open-circuit series resonate frequency closest to the carrier frequency. The characteristic impedance was verified by measuring the impedance at frequencies corresponding to odd multiples of 1/8 wavelength immediately above and below the open circuit series resonant frequency closest to the carrier frequency, while the line was open-circuited at the sample element end of the line. The characteristic impedance was calculated by the following formula:

$$Z = \sqrt{\sqrt{R_1^2 + X_1^2} \times \sqrt{R_2^2 + X_2^2}}$$

*where:*

*Z = Characteristic impedance and*

*R<sub>1</sub> + j X<sub>1</sub> and R<sub>2</sub> + j X<sub>2</sub> are the measured impedances*

*at ± 45 degrees offset frequencies.*

A tabulation of the measured sample line lengths and the characteristic impedance of each line is contained in Figure 4. All sample line verification measurements were performed by the undersigned using a Hewlett-Packard, Model 4396A, network analyzer; an Amplifier Research, Model 5W1000, power amplifier; and a Tunwall Radio directional coupler. As demonstrated by the measured values in Figure 4, the measured sample line lengths are within 1 electrical degree with respect to

each other and the measured characteristic impedances are well within 2 ohms of each other, as required by Section 47 CFR 73.151(c)(2)(I) of the FCC Rules and Regulations.

An impedance measurement was performed at the input to each sample line, at the antenna monitor end of the line, with the toroidal current transformer connected. The measurement was performed at the KTEK operating frequency of 1110 kilohertz. The measured sample line impedances with the current transformers connected are tabulated in Figure 4 under the heading "Reference Impedance Sample Transformer Connected." The impedance measurement in Figure 4 for the tower #5 sample line was performed with the replacement current transformer as discussed below.

The performance of the toroidal current transformers was verified by driving a common reference current through all six transformers and comparing the relative outputs as observed on the Potomac Instruments Model 1901-6 antenna monitor. Based on the test results, it was determined that the performance of the current transformer installed in the ATU for tower #5 was operating outside of the manufacturer's stated tolerance. Therefore, a replacement current transformer was purchased for tower #5 and the test was repeated. The second test confirmed that the performance of all six of the KTEK current transformers is well within the manufacturer's stated accuracy. A tabulation of the toroidal current transformer measurement data and the serial number of each toroidal current transformer is contained in Figure 5.

The antenna monitor that is employed at KTEK is a Potomac Instruments, Model 1901-6, Serial Number 365, last calibrated by the manufacturer in January, 1999. The performance of the antenna monitor was verified, by the undersigned, to be well within

the manufacturer's stated accuracy. The verification was performed by comparison of the measured relative directional operating parameters, as observed on the antenna monitor, with those measured using the network analyzer when the phasing and coupling system common point was driven with the network analyzer swept source through a power amplifier.

### **3.0 COMMON POINT IMPEDANCE AND COMMON POINT CURRENT**

The networks associated with the directional antenna system were adjusted for proper impedance transformation and the common point impedance matching network was set for  $Z = 50 + j14.4$  Ohms. The transmitter output power level was adjusted for a daytime common point current of 7.35 amperes and a critical hours common point current of 6.43 amperes (controlled RMS).

### **4.0 REFERENCE FIELD STRENGTH MEASUREMENTS**

Reference field strength measurements were performed on the KTEK daytime directional pattern on the 329° radial bearing, corresponding to the pattern main radiation lobe; and the 74.5°, 130°, 161.5°, and 216.5° radial bearings, corresponding to the directional pattern minima. Three reference field strength measurements were performed on each of the selected radial bearings.

The measurements were performed by Mr. Douglas Allen, Chief Engineer of Station KTEK. The meter that was employed to perform the measurements is a

Potomac Instruments, Model FIM-41, Serial Number 370, last calibrated by the manufacturer in April 2012.

The measured field strength value for each established reference point location is tabulated in Figure 6, Sheets 1 through 3. The tabulations contained in Figure 6 also include for each reference location; GPS coordinates (NAD83), distance from the KTEK array center, and a description of measurement location.

#### **5.0 ANTENNAS MOUNTED ON TOWER AND ISOLATION CIRCUITS**

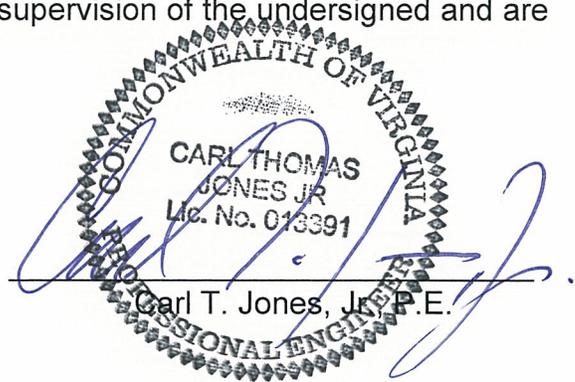

There are no other antennas mounted on the KTEK towers. Lighting chokes are mounted in the ATU enclosures for towers 1, 3, 4, and 6 to allow the lighting system electrical wires to cross the base insulator. Third wire of the lighting choke is used as a tower static drain. Static drains are installed in the ATU enclosure for towers 2 and 5.

#### **SUMMARY**

It is submitted that the KTEK directional pattern performance has been verified using computer modeling and sample system verification procedures in accordance with 47 CFR 73.151(c). It is believed that the daytime and critical hours antenna systems, as adjusted, fully comply with the terms of the station's FCC Authorization and all applicable FCC Rules and Regulations. It is requested that a superseding license be issued to STB reflecting the new MoM model derived operating parameters as contained herein.

This engineering statement and the attached figures and appendices were prepared by the undersigned or under the direct supervision of the undersigned and are believed to be true and correct.

Dated: November 30, 2012

APPENDIX B – DAYTIME DIRECTIONAL ARRAY MODEL  
 KTEK(AM) – ALVIN, TEXAS

PEAK CURRENT - DAYTIME  
 Frequency = 1.11 MHz  
 Input power = 2,500. watts  
 Efficiency = 100. %  
 coordinates in degrees
