Re: WFUV Antenna/Bronx, NY/Our file #6836.99

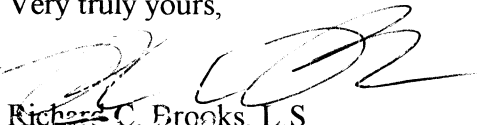

Dear Mr. Beverage,

On November 19th 2005 and December 14th 2005 the orientation of the tower faces and antennas were located by field triangulation and conventional survey methods with respect to True North reference. The margin of error is 0.5 degrees plus or minus.

It was determined that; the azimuth of the perpendicular line drawn thru the main tower face is 62.5 degrees from true north, the azimuth of the main antenna is 65 degrees from true north and the azimuth of the auxiliary antenna is 62.5 degrees from true north.

If you have any questions please do not hesitate to contact the office.

Very truly yours,

Richard C. Brooks, L.S.
