

**Wallingford Broadcasting
Directional Antenna for WLFX, Berea, Ky
Survey Report**

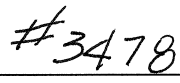

The ultimate goal of this project was to establish true north and place a mark located as far from the tower leg as possible along an azimuth of 252°. This mark is to be used by the directional antenna installer to align the antenna.

The original mark was established using Global Positioning System and the antenna installed.

We returned afterward to the site and re-established the Azimuth and checked the alignment of the antenna and found it to be correctly oriented to 252° from True North.

I the undersigned certify that these markings and measurements are true and accurate and that all the work was done by me or under my direct supervision.
