

**Exhibit E-7**

The facility was constructed complete in accordance with the terms of the construction permit with the exception of one parameter. This parameter is the effective radiated power. The construction permit authorized an effective radiated power of 200 kW. Due to limitations on the transmitter, the applicant seeks to reduce this effective radiated power to 190 kW. At this level, the facility still provides the required coverage over the community of license.

The effective radiated power authorized under the construction permit was 200 kW. This corresponds to an ERP value of 23.01 dBk. The requested ERP as part of this license application is 190 kW, which corresponds to 22.79 dBk. The difference between these values of 0.22 dB is clearly less than 0.5 dB, therefore, it is believed that the applicant may file a 302-DTV to modify the effective radiated power based on a discussion with the Commission's Staff. A coverage map has been included with this exhibit to demonstrate that the applicant would still provide the required signal level over the community of license. This map was computer generated using a commercially available software package.
