Technical Narrative

The technical exhibit of which this narrative is part was prepared to support an application for construction permit for WCFB(FM) on Channel 233C assigned to Daytona Beach, Florida. This application seeks to operate on Channel 233C0 from a transmitter site located 14.8 kilometers (9 miles) from its presently licensed site with an effective radiated power of 97 kilowatts and an antenna height above average terrain of 453 meters. This is a maximum equivalent Class C0 facility.

The proposal would not be subject to environmental processing in accordance with Section 1.1306. It is believed that this proposal conforms with all applicable rules and regulations of the FCC.

The proposed transmitting antenna will employ 0.75° electrical beamtilt pursuant to the specifications provided by the antenna manufacturer contained within the Appendix. There will be 93.5 kilowatts radiated in the horizontal plane and a maximum of 97 kilowatts radiated at a horizontal depression angle of 0.75°.

Interference Concerns

The 115 dBu predicted "blanketing" contour of the proposed station would extend radially less than 4 kilometers from the transmitting site. The applicant recognizes its responsibility to resolve complaints of interference, including blanketing and receiver-induced interference as required by Sections 73.315(b), 73.316(e) and 73.318.

Proposed Coverage Analysis

Figure 2 is a map showing the predicted coverage contours for the proposed operation. The FCC proposed 70 dBu contour does entirely encompass the principal community of Daytona Beach, Florida pursuant to Section 73.315(a) of the Commission's Rules.

The average terrain elevations from 3 to 16 kilometers along eight radials evenly spaced at 45 degree intervals were obtained from the co-located WMGF(FM) Channel 299C application for construction permit.

Proposed Site Allocation Study

Channel 233C0 at the proposed site will satisfy the Commission's minimum separation distance requirements, specified in Section 73.207(b) of the Rules, to all assignments and stations as shown by the tabulation provided in Figure 3.

Radiofrequency Electromagnetic Field Exposure

The proposed facility has been evaluated in terms of potential radiofrequency electromagnetic field exposure at ground level in accordance with OET Bulletin No. 65, *Evaluating Compliance with FCC Specified Guidelines for Human Exposure to Radiofrequency Electromagnetic Fields*.¹ The power density at the base of the tower was calculated using the appropriate procedure contained in Section 2, Supplement A, *Additional Information for Radio and Television Broadcast Stations*, of the Bulletin.

For the calculation, a combined horizontal and vertical polarized effective radiated power of 200 kilowatts is employed with a radiation center of 446 meters above ground level. Using an assumed "worst-case" downward relative field value of 0.5, it is calculated that the maximum power density at ground level resulting from this facility is less than 0.008 mW/cm². This is less than five percent of the maximum Commission guideline value in an uncontrolled environment for a FM radio station.²

¹ OET Bulletin 65, Second Edition 97-01, August, 1997.

² The FCC maximum guideline for a FM broadcast station in an uncontrolled environment is 0.2 mW/cm².

It is noted that this technical exhibit only addresses the potential for radiofrequency electromagnetic field exposure. All other aspects of the environmental processing analysis are the responsibility of the applicant.
