

Environmental Statement

The requested facilities will not adversely affect the environment. There will be no structural changes to the existing tower/antenna system. The requested facility will not be placed into operation until the existing analog operation on the same channel is shut down. This will result in a substantial decrease in RF emission compared to the existing analog operation.

The public will be protected from exposure through the combined efforts of restricted site access via locked fences, and appropriate warning signs posted around the perimeter of the facility.

Persons with authorized access to the tower site will be protected by a mandatory requirement to adhere to locally posted procedures restricting access to any area which might expose them to unsafe levels of RF radiation.
