EXHIBIT E-1

ALLOCATION AND INTERFERENCE STUDY

PROPOSED KTVI-DT
CHANNEL 43 - SAINT LOUIS, MISSOURI

The Commission allotted Channel 43 to KTVI-DT with a nominal ERP of 1000 kw at 335 meters above average terrain, and KTVI-DT is licensed to operate with 834 kilowatts at 337 meters. The instant application specifies an ERP of 1000 kw, nondirectional, at 337 meters, which is allowable under the FCC's *de minimis* standards with respect to various NTSC and DTV facilities.

In evaluating the interference effect of this proposal, we have relied upon the V-Soft Communications "Probe" computer program, which has been found generally to mimic the FCC's program. Changes in interference caused by KTVI-DT to other pertinent stations are tabulated in Exhibit E-2.

As indicated, the proposed KTVI-DT facility would not contribute more than two percent DTV interference to the service population of any affected NTSC or DTV station. In addition, this proposal does not result in any NTSC or DTV station receiving more than ten percent total DTV interference to viewers living within its present service area.

Therefore, this proposal meets the FCC's *de minimis* interference standards for DTV operations.

This interference study employs a signal resolution (cell size) of 1 kilometer, instead of 2 kilometers, and a profile spacing increment of 0.1 kilometer instead of 1 kilometer. In doing so, we rely on the Commission's August 10, 1998, Public Notice "Additional Applications Processing Guidelines for DTV."
