

**Spurious Emissions Report for Auxiliary Transmitting  
Antenna for  
KLLC-FM and KIFR-FM  
San Francisco, CA**

Measurements were taken on August 17, 2006 using a Hewlett-Packard spectrum analyzer model 8591A.

Settings were:

Frequency span: 20MHz

Signal amplitude: 80 Db

Frequency center: 100 MHz

Sweep rate: 20 mSec

Sample was taken directly from ERI directional coupler mounted on the output of the ERI Model MA970F06-000-U13, Two-Port Combiner.

Spurious emissions were found to be compliant with CFR47 73.317(b, c, d).  
Spurious emissions were greater than 80 Db down more than 600 KHz away from center frequency for both stations.
