

WSLS-TV, Schedule 381

Licensee submits information relevant to the questions asked by the Commission on Schedule 381. First, in addition to anything else listed on FCC Form 2100 Schedule 381, WSLS-TV owns a Harris/Gates DHD8P1 1.8 kW UHF transmitter used in the case of total failure of its main transmitter and a Dielectric TLP-24H antenna fed with a transmission line of 150 feet of 3 1/8" rigid line.

Second, all stations utilize mask filters as part of their transmitter systems. Additionally, certain stations use more than one amplifier -- in these instances, the station utilizes a combining system.

Combining systems are part of the station's antenna system. Stations with shared-use antenna systems use combining systems to allow energy to be delivered to the antenna without delivering significant RF levels to the transmitters of the other stations sharing the antenna.
