

## **EXHIBIT WITH RESPECT TO TRANSMISSION LINE LENGTH**

The transmission line is rigid, but do not know actual lengths. The only way to know would be to climb the tower and measure three to four sections. The line going from building to tower is in odd lengths due to distance. and there would be a couple of odd lengths for the vertical run since it is not divisible by 20'.

This information is provided in response to the item that permits an explanation closest to the transmission line item. The licensee has checked 20' in order to file the form, although as explained above, that length is not necessarily correct.
