

**General Information Exhibit**

This exhibit is to highlight certain factors affecting KCRA-TV's transmitter site that are not otherwise apparent from the information solicited and provided in the instant Pre-Auction Certification form. These factors may affect the station's ability to timely undertake facilities modifications if the station's site is subject to repacking and may otherwise complicate any repacking scenario on the tower KCRA-TV shares with other television stations and non-broadcast users.

As referenced in the Pre-Auction Certification form, KCRA-TV (channel 35) shares its broadband antenna with KQCA (channel 46) and KMAX-TV (channel 21). The three television stations also share transmission line and a combiner. If even only one of the three stations is repacked, it will affect all three stations even if the other two remain on their current channels with their current operating parameters.

While the antenna and transmission line shared by the three stations are both broadband, any change in channels will require construction and power-down coordination not only among the three stations using the antenna but also the other tenants on the tower. California State Air Quality is a tenant on the same tower with numerous air quality sensors installed throughout the tower, and there is another broadcaster with a side mount antenna lower on the tower (KSPX-TV, channel 48). All tenants will have their operations affected should any work on the tower be required. Thus, multiple parties have a vested interest in minimizing the impact of the repack if one or more of the stations on the antenna KCRA-TV shares is ultimately assigned a new channel.
