Mr. Jenkins,

Regarding WPRI'S existing antenna, Model TF-12BH-SP, it is Dielectric's recommendation that the antenna be replaced for operation at Channel 7.

The existing old antenna was designed and factory optimized for Channels 12 & 13. While theoretically the TF antenna can be designed at more widely spaced Channels between 7-13, this particular design incorporated feed system components that are now obsolete and are no longer available. New feed system components have exhibited more limited bandwidth. This means any field attempted modifications to Channel 7 would be extremely time consuming and expensive, with no guarantee of success.

Dielectric therefore recommends the old TF-12BH-SP antenna be replaced for use at Channel 7.

Kindest regards,
