

ENGINEERING STATEMENT

The engineering data contained herein have been prepared on behalf of VENTURE TECHNOLOGIES GROUP, LLC, licensee of Class A digital television station WEPT-CD, Channel 22 in Newburgh, New York, in support of its Application for Construction Permit to specify operation on its post-repack channel, Channel 28. No change in site location, antenna azimuth pattern or antenna height is proposed herein.

It is proposed to mount a Dielectric TLP-4B directional elliptically-polarized antenna at the 87-meter level of the existing 91-meter tower on which the present WEPT-CD antenna is located. The proposed effective radiated power for the facility is 15.0 kW in the horizontal plane, which is the allotted repack power level for WEPT-CD. Exhibit B is a map upon which the predicted 51 dBu service contour is plotted.

Elevation and azimuth pattern information for the proposed Dielectric antenna appear in Exhibit C. Since the facility proposed herein specifies the exact repack allotment facility assigned to WEPT-CD, no interference study is included herein. A detailed power density calculation is provided in Exhibit D.

Since no change in the overall height or location of the existing WEPT-DT tower is proposed herein, the Federal Aviation Administration has not been notified of this application. In addition, the Federal Communications Commission issued Antenna Structure Registration Number 1018749 to this tower.

EXHIBIT A

I declare under penalty of perjury that the foregoing statements and the attached exhibits, which were prepared by me or under my immediate supervision, are true and correct to the best of my knowledge and belief.

A handwritten signature in blue ink, appearing to read "K. T. Fisher". The signature is stylized with a large "K" and "F" and a smaller "T".

POWER DENSITY CALCULATION

PROPOSED WEPT-CD
CHANNEL 28 – NEWBURGH, NEW YORK

Since the FCC considers the possible biological effects of RF transmissions in its environmental determinations, we have studied the matter with respect to this Newburgh facility. Employing the methods set forth in *OET Bulletin No. 65* and considering a main-lobe effective radiated power of 15.0 kW (H,V), an antenna radiation center 87 meters above ground, and the specific elevation pattern of the proposed Dielectric TLP-4B CP antenna, maximum power density two meters above ground of 0.0078 mW/cm^2 is calculated to occur 66 meters from the base of the tower. Since this is only 2.0 percent of the 0.37 mW/cm^2 reference for uncontrolled environments (areas with public access) surrounding a facility operating on Channel 28 (554-600 MHz), a grant of this proposal may be considered a minor environmental action with respect to public exposure to non-ionizing electromagnetic radiation.

Further, the station owner will take whatever precautionary steps are necessary, such as reducing power or leaving the air temporarily, to ensure that workers operating in the vicinity of the antenna are not exposed to excessive non-ionizing radiation.
