# KHRR Application for Modification of Post-Repack Construction Permit October 29, 2017 

## Engineering Exhibit

The purpose of this application is to request modification of a post-repack construction permit (LMS file number 0000026323) for operation on channel 16 for KHRR, Tucson, AZ, Facility ID 30601, licensed to NBC Telemundo License LLC.

This application specifies the same top mount antenna location at the same radiation center height of 1387.3 meters AMSL and the same 622.0 meters height above average terrain (HAAT) on the same tower as authorized in construction permit LMS file number 0000026323 , but with a maximum effective radiated power (ERP) of 396 kW . A TVStudy 2.2 .3 analysis using the default 2 km cell size and 1 km terrain profile point spacing of the proposed increase to 396 kW ERP showed the maximum amount of new interference created to any post-auction baseline facility, any application filed in the replication and first priority windows, and any granted post-auction construction permits in the LMS database dated October 26, 2017 was under 0.5\%. The study showed no increase in interference (zero percent) from the proposed facility to population either in Mexico or the U.S. served by the Mexican facilities identified in TVStudy

## Antenna System

The proposed facility will use a directional antenna with elliptical polarization. The proposed vertically polarized ERP is 99.0 kW . The vertically polarized ERP will not exceed the horizontally polarized ERP ( 396 kW ) in any direction. Plots and tabulation of antenna data required by FCC Rules Section 73.625(c) are attached.

## Environmental Statement

The requested facility will be installed on top an existing tower, located in an antenna farm. The proposed top mount antenna replaces an existing antenna and will not increase the height of the tower above 199 feet.

RF power density from the facility using combined horizontal and vertically polarized ERP was calculated using the procedures described in FCC Office of Engineering and Technology Bulletin 65. The maximum power density at the site, allowing for 4 meter building height and 2 meter person height, is calculated to be 0.0319 $\mathrm{mW} / \mathrm{cm}^{2}$ or $9.88 \%$ of the FCC maximum permissible exposure level of $0.323 \mathrm{~mW} / \mathrm{cm}^{2}$ at 485 MHz for an uncontrolled environment. The area where this power density is present is not accessible to the public and is protected by a fence and locked gate with required signage. At full power, RF power density on towers closer than 102 meters to this facility is calculated to exceed occupational exposure levels. KHRR will coordinate with other users at the site and reduce power or shut off as required to protect workers on this and nearby towers from RF exposure above the limits specified in FCC rule §1.1310.

## Broadcast Facility

Compliance with 73.616:
A study using TVStudy 2.2.3 and the FCC LMS database dated 10/26/2017 showed the proposed facility complies with the interference requirements of Section 73.616 with regards to any post-auction baseline facility, any application filed in the replication and first priority window, and any granted post-auction construction permita when studied with the default settings of 2 km cell size and 1 km terrain profile point spacing.

Compliance with 73.622(i):
The proposed facility will operate on the channel assigned to KHRR for operation post-repack. The proposed KHRR facility has a service area of $34,930.2$ square kilometers, which is less than the service area of 58,113.2 square kilometers of KUAT-TV (Facility ID 2731), which is licensed in the same DMA (Tucson), and thus complies with the Section $73.622(\mathrm{f})(5)$ limit on permissible maximized coverage area and the ERP and HAAT limits in $73.622(\mathrm{f})(8)$ do not apply. KHRR is currently authorized to use the proposed 396 kW ERP on its current channel (40).

## KHRR Application for Modification of Post-Repack Construction Permit (continued)

Compliance with 73.623(e):
Not applicable. This application does not change the assigned channel or location of the authorized station.
Compliance with 73.625:
The proposed facility extends the contour previously approved by the Commission and will place a $48 \mathrm{~dB} \mu \mathrm{v} / \mathrm{m}$ principle community contour over Tucson, Arizona, the community of license. See KHRR Proposed Coverage map, attached.

Compliance with 73.1030:
A TVStudy analysis did not identify any requirement for coordination with facilities listed in 73.1030.

## Compliance with 73.1125:

The proposed facility extends the contour previously approved by the Commission and will place a $48 \mathrm{~dB} \mu \mathrm{v} / \mathrm{m}$ principle community contour over the main studio located at 5151 E. Broadway Blvd, Suite 650,Tucson, AZ 85711. See KHRR Proposed Coverage map, attached.

Section 73.1650 Considerations:
This facility is 93.9 km from the Mexican border and within the coordination distance.
A TVStudy analysis shows no new interference to XHCCS, LMS file number BPFS20160315AAE, on channel 16 in Cananea, SO. TVStudy shows unique interference from the KHRR FCC baseline facility to 0 people in the Unitied States and to 4 people in Mexico. The proposed facility does not change this interference.

In the "Exchange of coordination letters with IFT Regarding DTV Transition and Reconfiguration of 600 MHz Spectrum (July 2015)", "Table 6: Pre-Incentive Auction US Post-Transition DTV Allotment Plan" on pages 13 and 14 shows the KHRR coordinated effective radiated power (ERP) is 396 kW based on an antenna at 1383.2 meters AMSL. This application, proposes the coordinated ERP of 396 kW but at a height of 1387.3 meters AMSL. The 4 meter increase in height was due to a more accurate determination of the tower location and ground elevation.

This slight increase in antenna height and small differences in the coordinated antenna pattern and the antenna pattern selected to match the FCC replication pattern result in a very small contour extension beyond the channel 16 contour created using the ERP, antenna height, and antenna pattern from IFT's Table 6. The maximum calculated contour extension in Mexico compared to the contour created from IFT Table 6 is under 300 meters as shown in the map measurement below:

## KHRR Application for Modification of Post-Repack Construction Permit (continued)

Section 73.1650 Considerations (continued):
The difference in the contour created using IFT Table 6 parameters (red dashed line) and the proposed Service Area Contour (blue solid line) becomes indistinquishable on a 1,250,000:1 coverage map, as shown in the KHRR Proposed Coverage Map below:
