

DISPLACEMENT QUALIFICATION OF WNTD-LD

As shown in the included TVStudy IX analysis of the existing facility of WNTD-LD on Channel 36, it will cause impermissible interference of 1.35% to Full Service station WCCV-TV, 1.91% IX to WIMN-CD, and 13.87% to Full Service station WVOZ-TV, thus the station qualifies for displacement application. No change in the licensed site or antenna height is proposed.

As shown in the included Post Repack TVStudy interference analysis, the proposed WNTD-LD facility on CH 30 is not predicted to cause impermissible interference to any Class A or Full service station. The proposed facility of WNTD-LD is predicted to receive interference levels above 2%, but this IX is accepted.

As all the Puerto Rico TV stations transitioned to their Post-Repack channels on July 31st, this application can be granted right away. It should be noted that the amended Post Repack TVStudy IX analysis for WNTD-LD has been run with the L-R parameters of a Cell Size of 0.5 km, and L-R profile increments of 0.1 km.
