

Compliance with Construction Permit Condition

Section 1.30002(a) of the FCC Rules requires that steps be taken to protect a nondirectional AM station if the tower being constructed or modified is located within one wavelength of the AM station. Here, KZYM(AM) operates at 1230 kHz. At that frequency, one wavelength is 799.7 feet, or 243.7 meters. This distance is substantially less than the 1,342 feet, or 409 meter, distance between the two towers. Thus, the additional requirements of Section 1.30002(a) are not applicable.
