Compliance with Special Operating Conditions

The KMVS Construction Permit (File Number 0000109618) contains two Special Operating Conditions:

1. *The permittee/licensee in coordination with other users of the site must reduce power or cease operation as necessary to protect persons having access to the site, tower or antenna from radiofrequency electromagnetic fields in excess of FCC guidelines.*

2. *The relative field strength of neither the measured horizontally nor vertically polarized radiation component shall exceed at any azimuth the value indicated on the composite radiation pattern authorized by construction permit BMPED-20080618APB. A relative field strength of 1.0 on the composite radiation pattern herein authorized corresponds to the following effective radiated power: 0.043 kilowatt (H&V). Principal minima and their associated field strength limits: 80 to 90 degrees True 0.00135 kilowatt*

Educational Media Foundation (“EMF”) complies with, or agrees to, the conditions as follows:

1. EMF in coordination with other users of the site agrees to reduce power or cease operation as necessary to protect persons having access to the site, tower, or antenna, from radiofrequency electromagnetic fields in excess of FCC guidelines.

2. Exhibit 9-A, figure 1e, confirms that at no point does the measured antenna pattern exceed the FCC Composite pattern as seen in figure 1f. This holds true for the 80 to 90 degrees True effective radiated power not exceeding 0.00135kw.

Report of Test CA5-FM/CP/RM Yagi

for

Educational Public Radio, Inc

KLSI 89.3 MHz Moss Beach, CA

OBJECTIVE:

The objective of this test was to demonstrate the directional characteristics of a CA5-FM/CP/RM to meet the needs of KLSI and to comply with the requirements of the FCC construction permit, file number BMPED-20080618APB.

RESULTS:

The following Figures are the results of the measurements from our pattern range:

Figure 1A - Measured Azimuth Pattern with the FCC Composite
Figure 1B - Measured Composite Azimuth Pattern with the FCC Composite
Figure 1C - Tabulation of the Horizontal Polarization for the Measured Azimuth Pattern
Figure 1D - Tabulation of the Vertical Polarization for the Measured Azimuth Pattern
Figure 1E - Tabulation of the Measured Composite Azimuth Pattern
Figure 1F - Tabulation of the FCC Composite

The calculated elevation pattern of the antenna is shown in Figure 3.

Construction permit file number BMPED-20080618APB indicates that the Horizontal radiation component shall not exceed 0.043 kW at any azimuth and is restricted to the following values at the azimuths specified:

73 - 93 Degrees T: 0.00135 kW

From Figure 1A, the maximum radiation of the Horizontal component occurs at 264 Degrees T to 276 Degrees T. At the restricted azimuth of 73 - 93 Degrees T the Horizontal component is 15.24 dB down from the maximum of 0.043 kW, or 0.00129 kW.

The R.M.S. of the Horizontal component is 0.433. The total Horizontal power gain is 2.715. The R.M.S. of the Vertical component is 0.433. The total Vertical power gain is 2.450. See Figure 4 for calculations. The R.M.S. of the FCC composite pattern is 0.523. The R.M.S. of the measured composite pattern is 0.455. Eighty-five percent (85%) of the original authorized FCC composite pattern is 0.445. Therefore this pattern complies with the FCC requirement of 73.316(c)(2)(ix)(A).

METHOD OF DIRECTIONALIZATION:

One bay of the CA5-FM/CP/RM was mounted on a pole of precise scale to the 2 3/8 inch OD pole attached to a wooden telephone pole at the KLSI site. See Figure 2 for mechanical details.

METHOD OF MEASUREMENT:

As allowed by the construction permit, file number BMPED-20080618APB, a single level of the CA5-FM/CP/RM was set up on the Howell Laboratories scale model antenna pattern measuring range. A scale of 4.5:1 was used.

SUPERVISION:

Mr. Surette was graduated from Lowell Technological Institute, Lowell, Massachusetts in 1973 with the degree of Bachelor of Science in Electrical Engineering. He has been directly involved with design and development of broadcast antennas, filter systems and RF transmission components since 1974, as an RF Engineer for six years with the original Shively Labs in Raymond, ME and for a short period of time with Dielectric Communications. He is currently an Associate Member of the AFCCE and a Senior Member of IEEE. He has authored a chapter on filters and combining systems for the latest edition of the CRC Electronics Handbook and for the 9th and 10th Editions of the NAB Handbook.

EQUIPMENT:

The scale model pattern range consists of a wooden rotating pedestal equipped with a position indicator. The scale model bay is placed on the top of this pedestal and is used in the transmission mode at approximately 20 feet above ground level. The receiving corner reflector is spaced 50 feet away from the rotating pedestal at the same level above ground as the transmitting model. The transmitting and receiving signals are carried to a control building by means of RG-9/U double shielded coax cable.

The control building is equipped with:

Hewlett Packard Model 8753 Network Analyzer

PC Based Controller

Hewlett Packard 7550A Graphics Plotter

The test equipment is calibrated to ANSI/NCSL Z540-1-1994.

TEST PROCEDURES:

The corner reflector is mounted so that the horizontal and vertical azimuth patterns are measured independently by rotating the corner reflector by 90 degrees. The network analyzer was set to 401.85 MHz. Calibrated pads are used to check the linearity of the measuring system. For example, 6 dB padding yields a scale reading of 50 from an unpadded reading of 100 in voltage. From the recorded patterns, the R.M.S. values are calculated and recorded as shown in Figure 1A.

S.O. 27520 Figure 4

VALIDATION OF TOTAL POWER GAIN CALCULATION

KLSI Moss Beach, CA

CA5-FM/CP/RM

Elevation Gain of Antenna 0.509

Horizontal RMS value divided by the Vertical RMS value equals the Horiz. - Vert. Ratio

H RMS	0.433	V RMS	0.433	H/V Ratio	1.000

Elevation Gain of Horizontal Component 0.509

Elevation Gain of Vertical Component 0.509

Horizontal Azimuth Gain equals $1/(RMS)^2$. 5.334

Vertical Azimuth Gain equals $1/(RMS/Max\ Vert)^2$. 4.814

Max. Vertical 0.950

***Total Horizontal Power Gain is the Elevation Gain Times the Azimuth Gain**

Total Horizontal Power Gain = **2.715**

***Total Vertical Power Gain is the Elevation Gain Times the Azimuth Gain**

Total Vertical Power Gain = **2.450**

==========

ERP divided by Horizontal Power Gain equals Antenna Input Power

0.043	kW ERP	Divided by H Gain	2.715	equals	0.02	kW H Antenna Input Power

Antenna Input Power times Vertical Power Gain equals Vertical ERP

0.02	kW	Times V Gain	2.450	equals	0.04	kW V ERP

Maximum Value of the Vertical Component squared times the Maximum ERP equals the Vertical ERP

(0.95)^2	Times	0.04	Equals	0.04	kW Vertical ERP

NOTE: Calculating the ERP of the Vertical Component by two methods validates the total power gain calculations
