

TECHNICAL STATEMENT  
K243BN LAVEEN, ARIZONA, CH. 243D  
MOUNTAIN COMMUNITY TRANSLATORS, LLC  
OCTOBER 2020

This Technical Statement is made in support of a minor modification of FM translator station, K243BN at Laveen, Arizona, facility ID 92373. K243BN seeks to remain at its current existing tower at the Shaw Butte communications site. It will remain rebroadcasting KLVK(FM) Fountain Hills, Arizona, facility ID 76329, on channel 206C1. Because of interference issues with KIKO-FM Claypool, Arizona, facility ID 11894, which recently upgraded on to a full class C station on channel 243,, K243BN seeks to decrease its Effective Radiated Power (“ERP”) from 250 watts to 3 watts. It will also replace its current one bay directional antenna with a higher gain Nicom BLK-5 yagi directional antenna to provide further protection to KIKO-FM. The new antenna will replace the current antenna at the same height on the tower. No other changes are being proposed. The following will show that the new proposed operation of K243BN will meet all of the Commissions technical requirements for an FM translator station.

Figure 1 is a detailed interference study conducted on channel 243D with these new proposed facilities. It shows that the new operation of K243BN will not cause any interference to any existing or proposed FM stations on any of the pertinent same channel or adjacent channels to channel 243 with the exception of second adjacent channel station, KMXP(FM) Phoenix, Arizona, facility ID 6361, operating on channel 245C and K241CS Phoenix, Arizona, facility ID 156046, channel 241D.

The proposed operation of K243BN on 243D is located within the protected 60 dB $\mu$  contour of 2nd adjacent channel of KMXP. Figure 2 shows the predicted F(50-50)

field strength of KMXP at the proposed K243BN transmitter site is 85.7 dB $\mu$ . Therefore, the respective predicted interfering contour F(50-10) generated by the proposed K243BN on channel 243D is an additional 40 dB $\mu$  or 125.7 dB $\mu$ .

The proposed operation of K243BN on 243D is located within the protected 60 dB $\mu$  contour of 2nd adjacent channel of K241CS. Figure 3 shows the predicted F(50-50) field strength of K241CS at the proposed K243BN transmitter site is 109.3 dB $\mu$ . Therefore, the respective predicted interfering contour F(50-10) generated by the proposed K243BN on channel 243D is an additional 40 dB $\mu$  or 149.3 dB $\mu$ . K241CS also has an outstanding Construction Permit (“CP”), BPFT-20170206ACK. This CP only calls for K241CS to increase its ERP from its current 200 watts to 250 watts and modify its directional antenna pattern. But it will remain at its present site and antenna heights. Thus the only effect of this application if granted will be to slightly increase the contour at the proposed K243BN site. K241CS is located on a tower directly adjacent to the proposed K243BN tower. Since the interference contour generated by K243BN will be larger towards KMXP(FM), only the 125.7 dB $\mu$  interference contour was studied for any population coverage.

Figure 4 shows the coverage area for the worse case 125.7 dB $\mu$  interference contour F(50-10) and shows that there is no population in the area of interference.

Figure 5 is a vertical pattern study showing that any potential interference contour towards KMXP(FM) will not reach the ground at any point.

The applicant, Mountain Community Translators, LLC, respectfully requests a waiver of C.F.R. 74.1204(d) of the Commission's rules based on the fact that there is no population within the area of predicted interference. There are no homes nearby the

proposed existing tower site, which is a privately owned on 1/2 acres with private locked access. The transmitter building is uninhabited and does not have indoor plumbing. The area around the tower base has restricted access. The site is a dedicated communications tower site on top of “Shaw Butte”. Should any unforeseen actual interference be caused, the licensee will immediately cease broadcasting with K243BN until such interference can be eliminated. It should also be noted, that with a reduction of ERP from 250 watts, as K243BN is currently licensed, to just 3 watts, this would only improve on any interference issues towards KMXP and K241CS.

Figure 6 is the directional antenna data for the proposed antenna.

It was found that the new proposed operation of K243BN Laveen, Arizona on channel 243D, will satisfy all of the required commission rules and regulations for an FM translator station.

Terrain database is NGDC 30 SEC , R= 73.215 qualifying spacings or FCC minimum Spacings in KM, M= Margin in KM In & Out distances between contours are shown at closest points. Reference zone= West Zone, Co to 3rd adjacent All separation margins (if shown) include rounding.

Ant Column: (D= DA Standard, Z= DA 73.215, N= Not DA 73.215, \_= Omni), Polarization (C, H, V, E), Beamtilt(Y, N, X)  
\*\*affixed to 'IN' or 'OUT' values = site inside restricted contour.  
Reference station has protected zone issue: Mexico

No actual interference will be caused to either KMXP(FM) or K241CS since the worst case 125.7 dbu contour will not cover any population. Also, since the only material change being proposed by K243BN with this application is a large reduction of ERP from 250 watts to 3 watts. Hence any currently licensed interference contours will only be reduced dramatically to KMXP and K241CS. See the Technical Statement for more details.
