

K297BY Directional Antenna Pattern Rotation

The underlying construction permit for K297BY was filed in CDBS, which allowed applicants to specify a directional antenna pattern rotation. A rotation of 295 degrees was specified.

In the license application in LMS, we are not provided the option to set or verify the pattern rotation. The applicant is given visibility only to the directional pattern relative field values. Those values are correct for the pre-rotation pattern.

We are including this exhibit to confirm that the K297BY antenna is installed at 295 degrees True as authorized, and this should be reflected in the database entry for this facility.
