

Diversity Showing for AZPM St. John Application

While the 60 dbu contour of the proposed AZPM St. John station overlaps the existing 60 dbu contour of an existing attributable station for diversity point purposes, the pertinent FCC rule, Section 73.7003(b)(2) clearly states that the applicable contour for local diversity points is the 3.16 mV/m contour (i.e., the 70 dbu contour).

The 70 dbu contour of AZPM's proposed St. John station does NOT overlap with the existing 70 dbu contour of any existing attributable stations for diversity point, and on the basis of the language in the actual (unamended) FCC rule, GPB is claiming diversity points.

See diversity map documentation showing 70 dbu contours and 60 dbu contours for attributable stations for diversity point purposes.
