

Directional FM Antenna System Proof of Performance

CP File Number 0000213726

WGCC Kendall, NY 90.7 MHz (FIN 23603)

February 1, 2024

Antenna Description

A custom-designed circular polarized FM antenna system was used to produce the directional azimuth pattern for FIN 23603 WGCC Kendall, NY 90.7 MHz, FCC CP file number: 0000213726. The Shively Labs **6815-2** FM antenna system consists of a circularly polarized antenna system mounted to a vertical structure. The antenna system elements are to be oriented to 95 degrees true north.

Description of Test Procedure

The test antenna consists of a 4.5 scaled circularly polarized antenna system mounted to a constructed structure that is identical to the final configuration. The structure and antenna system were mounted to a rotating platform. The platform is wooden, allowing the test antenna's center of radiation to be approximately 20 ft. above ground. All coaxial lines were properly grounded.

The antenna under test was the source antenna, terminated to the transmit port of the TR1300/1 2-Port Vector Network Analyzer. The VNA test instrument was set to 408.15 MHz ($408.15 = 90.7 \times 4.5$).

A broadband log-periodic horizontally and vertically polarized antenna system was used to receive the emitted signals. The receive antenna system is located approximately 56 ft from the transmit antenna. The receive antenna is located at the same height above ground as the antenna under test. The receive antenna is terminated to the receive port of TR1300/1 2-Port Vector Network Analyzer. A gain reference was documented using a single dipole tuned to 408.15 MHz ($408.15 = 90.7 \times 4.5$).

The antenna under test was rotated in a counterclockwise direction. The relative field strength was plotted using an HP PC-based computer system that documents the relative field strength of each azimuth degree angle. The computer system interfaces with the motorized platform and VNA test instrument, documenting the azimuth degree and relative field values. The system is calibrated to ANS/ISO/IEC 17025 standards.

Conclusions

The **6815-2** single level FM antenna system is to be mounted and oriented to 95 degrees true north. The antenna system should be installed in accordance with the provided installation drawing documents. No other antenna system or obstructions should be mounted within 10 ft of the antenna system. The antenna system orientation should be confirmed using a licensed surveyor.

The following figures are the results of the antenna proof of performance directional test procedure:

- Figure 1: Measured Vertical & Horizontal Azimuth Pattern with the FCC Composite
- Figure 2: Tabulation of the Horizontal Polarization for the Measured Azimuth Pattern
- Figure 3: Tabulation of the Vertical Polarization for the Measured Azimuth Pattern
- Figure 4: Tabulation of the Composite Polarizations for the Measured Azimuth Pattern
- Figure 5: Vertical Plane Relative Field Pattern
- Figure 6: Tabulation of Vertical Plane Relative Field
- Figure 7: Antenna Specifications
- Figure 8: Antenna Drawings

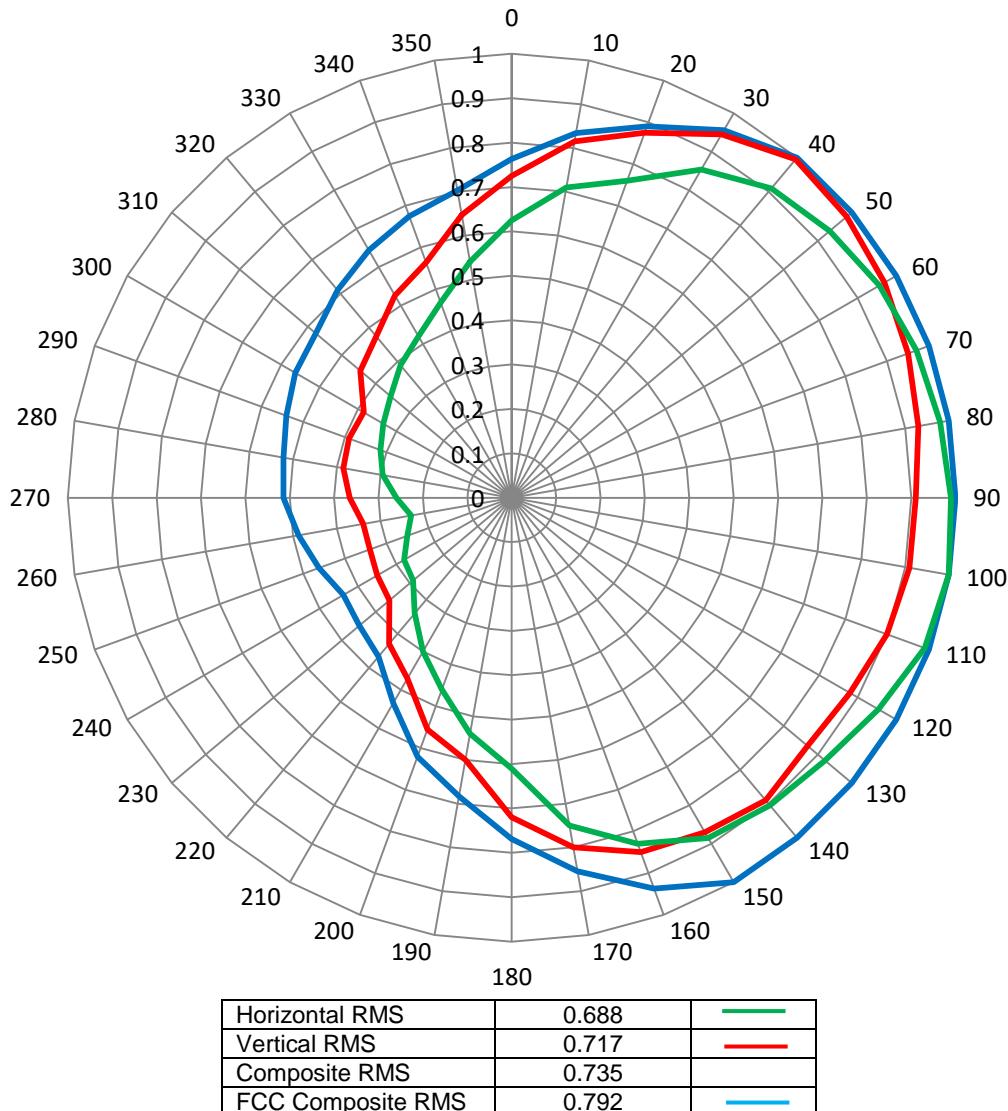

Figure #1 indicates the measured horizontal and vertical azimuth patterns do not exceed the FCC composite pattern at any azimuth. The FCC CP file number 0000213726 indicates that the power may not exceed 1.25 kilowatts at any azimuth. The power may not exceed 0.24 kilowatts at azimuth degree 240. The measured azimuth pattern does not exceed 1.25 kilowatts at any azimuth. The measured azimuth pattern does not exceed 0.24 kilowatts at azimuth degree 240.

The measured vertical relative field pattern RMS is greater than 85% of filed composite pattern. The measured composite pattern has an RMS that is 92.73 % of the filed composite pattern, as shown in Figure #1.
