General Information Exhibit

This exhibit is to describe certain factors present at the station's transmitter site that are not otherwise apparent from the information solicited and provided in the instant Pre-Auction Certification form. These factors will potentially affect the station's ability to timely undertake facilities modifications if the station's site is subject to repacking. The station's tower includes at least one radio station, which may present a challenge for repacking because coordination for work at the site will involve multiple parties with varied interests in the repack, all of whom must be willing to collaborate to ensure the safety of persons and equipment, the success of uninstalling and installing equipment, and minimizing interruptions to operations.
