

## KIEM-TV Tower Structural Analysis Status

The licensee regularly maintains such inspections of the antenna supporting structure for KIEM-TV (the “Tower”) as are necessary for insurance purposes. However, it is not clear at this time when the last formal structural analysis occurred on this relatively short Tower.

Note that the transmitting facilities of KIEM-TV are located on a mountain that is more than 800 meters above the city of license; thus there is no need for a tall tower to support the transmitting antenna for KIEM-TV. The overall height of the tower above ground is only 76 meters.

There has recently been a change in the technical personnel at the station. The new staff engineer is researching the history of the antenna supporting structure. Once the date of the last structural analysis of the tower is determined, this certification will be amended to supply that information as well as the technical standard under which such analysis was conducted.
