## Engineering Statement <br> Post-Auction Technical Facilities for KTFF-DT <br> Channel 23 at Porterville, CA <br> October 2017

## Expansion Application

This Engineering Statement has been prepared on behalf of Unimas Fresno LLC ("Unimas"), licensee of digital television station KTFF-DT at Porterville, California. KTFF-DT presently operates on Channel 48. The Commission's Channel Reassignment Public Notice (DA 17-314), released on April 13, 2017, specified the station's post-auction facilities on Channel 23.

This application specifies expansion facilities, and is being filed during the second filing window for alternate channels and expanded facilities.

## Compliance with §73.622(f) DTV maximum power and antenna heights

Processing is requested pursuant to the provisions of $\S 73.622(\mathrm{f})(5)$, which allows for technical facilities up to those needed to provide the same geographic coverage as the largest station within the market.

The table below demonstrates that the geographic coverage of the proposed noise limited contour will not exceed that of the largest station within the Fresno-Visalia market.

|  | Geographic Coverage <br> in United States $\left(\mathrm{km}^{2}\right)$ |
| :--- | :--- |
| KTFF-DT Ch23 <br> 330 kW at 1124 m HAAT | $40,075.7$ |
| KNSO(DT) Ch11 <br> 45 kW at 622m HAAT | $47,181.6$ |

## Interference Study

An interference study has been conducted using the Commission's TVStudy software. The results of the study demonstrate that this proposal will have no additional interference impact on other stations.

```

## Facilities Proposed

The proposed operation will be on Channel 23 with a maximum lobe effective radiated power of 330 kilowatts ( H pol) and $82.5 \mathrm{~kW}(\mathrm{~V}$ pol). Operation is proposed with a Dielectric model TFU-20DSB-M/VP-R antenna, which will be mounted on an existing tower at the Blue Ridge communications site. An FCC Antenna Structure Registration Number is not required for this tower.

## RF Exposure Calculations

The power density calculations shown below were made using the techniques outlined in OET Bulletin No. 65. "Ground level" calculations in this report have been made at a reference height of 2 meters above ground to provide a worst-case estimate of exposure for persons standing on the ground in the vicinity of the tower. The equation shown below was used to calculate the ground level power density figures from each antenna.

$$
\begin{aligned}
& S\left(\mu W / \mathrm{cm}^{2}\right)=\frac{33.40981 \times A \operatorname{djERP}(\text { Watts })}{D^{2}} \\
& \text { Where: } \begin{array}{l}
\text { AdjERP(Watts) is the maximum lobe effective radiated power times the element } \\
\text { pattern factor times the array pattern factor. } \\
D \text { is the distance in meters from the center of radiation to the calculation point. }
\end{array}
\end{aligned}
$$

Power density levels produced by the proposed facility were calculated for an elevation of 2 meters above ground using the manufacturer's vertical plane pattern for the Dielectric model TFU-20DSB-M/VP-R antenna. The highest calculated power density from the proposed antenna alone occurs at at a point 11 meters from the base of the antenna support structure. At this point the power density is calculated to be $143.3 \mu \mathrm{~W} / \mathrm{cm}^{2}$, which is $41 \%$ of $349.3 \mu \mathrm{~W} / \mathrm{cm}^{2}$ (the FCC maximum for uncontrolled environments at the Channel 23 frequency).

There are a number of other FM and TV stations at the Blue Ridge communications site, including one other full-power station which will be changing channel as a part of the repack. Measurements conducted in connection with the KTFF-DT renewal application in 2006 (see BRCT-20060804AFV) found a maximum reading of $40 \%$ of the uncontrolled environment MPE, with the majority of

## Hatfield \& Dawson Consulting Engineers

readings being $20 \%$ or less of the uncontrolled environment MPE. At that time, analog KTFF-TV was still operating on channel 61 with 2400 kW ERP. The analog operation has long since shut down, and it is anticipated that the total site exposure resulting from the instant proposal would be found to be commensurately lower than what was measured in 2006.

Pursuant to OET Bulletin No. 65, all station personnel and contractors are required to follow appropriate safety procedures before any work is commenced on the antenna tower, including reduction in power or discontinuance of operation before any maintenance work is undertaken. The permittee/licensee in coordination with other users of the site must reduce power or cease operation as necessary to protect persons having access to the site, tower or antenna from radiofrequency exposure in excess of FCC guidelines.
