

**Other Issues to Be Addressed Prior to Full Construction/Operation of WLFG**

January 2018:

As of January 2018, Channel 14 Land Mobile interference remediation has the potential to become an issue for WLFG. Because land mobile operations that may create interference cases will require resolution before full-power operations of WLFG can commence, the station will be challenged to resolve them during the testing period. The testing period for Transition Phase 2 will begin December 1, 2018, which is a time of year when it may be difficult—because of weather and holidays—to get the attention and cooperation of land mobile operators to work with the station to try filters and other possible remedies for any interference situations.

Also, removal of the station's current DTV Transmitter and construction/modification of existing cooling and power locations will be required. Preparations are being made to remove the old transmission equipment in order to create the necessary space for new transmission equipment.
