

Technical Summary

WPXH-TV Hoover, Alabama Channel 33 300 kW 318.4 (HAAT)

ION Media License Company, LLC (“ION”) licensee of television station WPXH-TV, Facility ID 73312, Hoover, Alabama (the “Station”) hereby amends its pending construction permit application seeking authority to relocate its transmitter from the currently authorized site to a site that will accommodate post-repack operations (FCC LMS File No. 0000034874).

This application is necessary because ION does not have access to its current tower for post-repack operations. Following the Commission’s assignment of post-repack facilities to WPXH-TV, ION was unable to reach accommodation with the tower landlord that would permit the station to continue operating from its current site. This forced ION to identify a new site for the station’s post-repack operations.

Before selecting the proposed tower site, ION performed a comprehensive analysis of available tower sites in the Birmingham market. In the immediate vicinity of the current tower site, ION’s market analysis found no acceptable alternatives that would provide equivalent interference-free coverage as compared to the Station’s pre-auction or authorized post-auction facilities. ION determined that the proposed site would provide the best option due to its structural capability and coverage performance, with minimal or no interference to other full-power broadcast stations.

The new tower is located 55 kilometers to the southwest of the current site. Accordingly, the Station’s proposed noise limited service contour (“NLSC”) will shift to the southwest, resulting in some areas of service gain and loss. Figure 1 shows the loss area and the stations predicted to serve the loss areas using the Commission’s standard prediction methodology. Under this analysis, the total size of the WPXH-TV loss area would be 358,003 persons over an area of 6,653 sq. km. WPXH-TV also would have a gain area of 337,467 persons and 8,983.6 sq. km. Thus, under the Commission’s traditional counter prediction methodology, WPXH-TV would have a net loss of 20,536 persons notwithstanding a gain area of 2,330.6 sq. km. WPXH-TV currently provides an over-the-air signal to 1,487,722 persons in its service area, so the predicted service loss using 50/90 curves would represent approximately 1.4% of WPXH-TV’s service population.

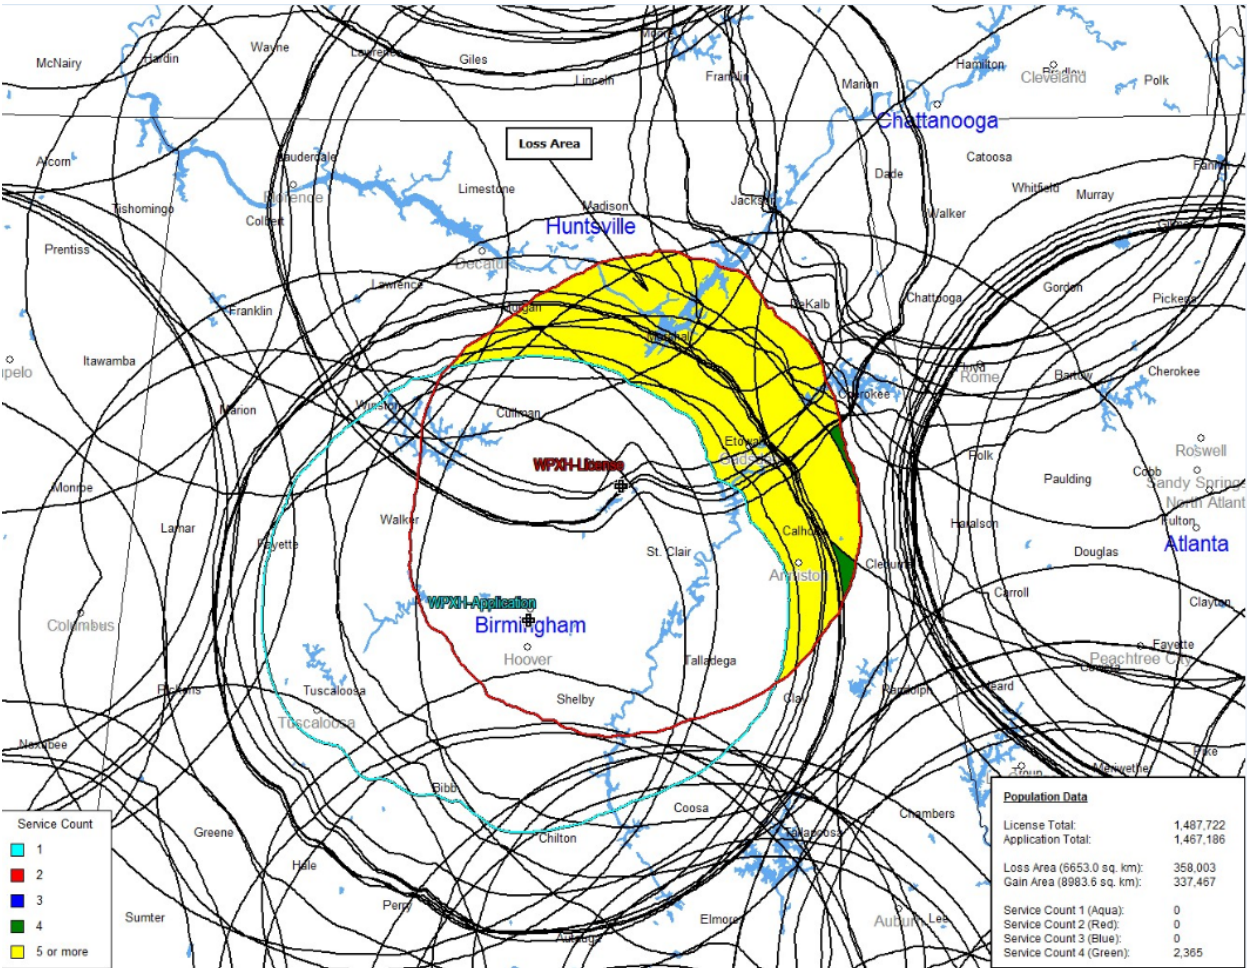

Figure 1 also demonstrates that the Commission's 50/90 curves predict that the majority of the loss area would remain well served by 5 or more over-the-air full-power television stations with a small area (2,365 persons or 0.16% of WPXH-TV's total service population) served by 4 stations. The proposed site relocation would not, of course, create any television coverage "white area."

ION has determined that the instant application will cause additional interference to a low-power television station that participated in the post-auction displacement window that occurred in 2018. The proposed operations would displace a construction permit for digital low power television station WBMA-LD (File No. 0000052973). However, given the exigent circumstances caused by ION's loss of access to its tower for post-auction operations, the displacement of this secondary service is necessary to ensure the continuation of ION's full-power over-the-air operations.

ION's proposed relocation of WPXH-TV is in the public interest and should be granted. First, ION's pre-repack tower site is unavailable for post-repack operations, and the current proposal is ION's best solution to implementing its reassignment to Channel 33. Given the loss of its current tower site, grant of authority to construct at the proposed location is necessary to ensure that ION can timely complete construction of the station's facilities by the September 6, 2019 Phase 5 transition deadline. Second, the requested tower site change is necessary for WPXH-TV to continue serving the vast majority of its viewers in the Birmingham market. Third, as a practical matter, very few viewers are likely to lose access to the programming available on WPXH-TV. ION network programming will remain available on area cable and satellite providers throughout the loss area, and approximately 90% of the viewers in the loss area subscribe to one of such services.

For the foregoing reasons, WPXH-TV requests that the staff promptly grant this Construction Permit Modification, as hereby amended. If the application is not granted, ION's ability to complete its transition to Channel 33 operations before the close of Phase 5 will be jeopardized.
