

KQTA-LD
Environmental Statement Exhibit
May 28, 2018

The combined three-way channel share facility proposes to operate at 244 meters AGL at 15 kW ERP circularly polarized. This proposal is well within both the FCC's controlled and un-controlled radiation exposure guidelines. Additionally, the site is fenced. An antenna will be employed that direct the radiated power out from the tower with minimal power directed downward towards the ground. Placards warning of radiation hazard have been posted in and around the site. Additionally, the staff of KQTA-LD will be trained how to cease operation in the event that anyone climbs the tower.
