

Statements regarding AM Station KMMS

The auxiliary facility antenna is installed on the antenna tower of AM station KMMS, which operates on 1450 kHz at Bozeman, Montana.

The construction permit bears a condition requiring impedance measurements on the KMMS antenna following construction. Post construction measurements showed a resistance of 52 ohms, which is less than a 2% change from the licensed value of 51.5 ohms. Therefore, there is no need for KMMS(AM) to submit a Form 302-AM application for return to direct power measurement.

Additionally, it was requested by FCC staff that the actual AM fencing distance be addressed in this license application. The existing fencing distance is 2 meters from the antenna tower.
