

# RFR Statement of Compliance

---

Based on the FCC's *FM Model* program, which considers the specific antenna type and predicts the power density at two meters above ground level, the proposed Shively 6812 Series, two-bay, full wavelength spaced antenna (EPA Type 1) is predicted to produce a maximum worst-case power density of  $195.3 \mu\text{W}/\text{cm}^2$  at two meters above ground level. Based on this calculation, the predicted power density represents only 97.7% of the FCC guideline value for uncontrolled RFR environments.

Further, the applicant is committed to reducing power and/or ceasing operation during times of service or maintenance of the transmission systems as necessary to avoid potentially harmful exposure to personnel. In light of the above, the proposed facility should be categorically excluded from RF environmental processing under section 1.1307(b) of the commission's rules.
