Request for clarification of those earlier provided dimensions. The answer to this showed the previous info considerably in error.

My proposal will include mounting the new channel 13 antenna somewhat lower than the existing channel 45 but still on the A leg. I have the tower leg diameter for 418.5' – 448.5' as 3-7/8" which seems awfully small for that tower. Could that be radius rather than diameter?
I will also need the diameter for 448.5' – 478.5' as the top bracket on the new proposed antenna will be in that range and the antenna manufacturer will need that dimension.

Thank you,
John

Morning,

The attached is a bit more current from 2016. Would this satisfy what you are looking for?

Thank you
Shannon

I'm trying to get my OAA filings done to replace our antenna on that tower. We were displaced last year on that July 13 deadline so we're already on a waiver to remain off the air.

The only tower mapping I can find is the one in the brochure which was from 2014. Obviously it's far from current and there is an error in at least one guy elevation. Before I put us all through this exercise I want to be sure the intended mounting area is clear. I think it actually needs to go about where our existing antenna is but if so it's not mounted where the FCC records show it to be.

If anything is available showing the current mapping it would be very helpful.

Thank you,

John Collinson
