

Reduced Power Exhibit

On or around June 17, 2022 WPTM(FM) suffered a lightning strike and is currently operating at 1,130 watts (or approximately 24% of authorized TPO). The damaged transmitter equipment had been returned to the manufacturer for repair and a reduced power notification was timely submitted to the FCC (see LMS File No. [0000193762](#)). The anticipated repairs will not materialize prior to the expiration of the 30 day reduced power window, therefore, the licensee respectfully requests special temporary authority to operate at reduced power until that time the transmitter is repaired and the station can return to normal, licensed operations.
