WAIVER REQUEST OF §73.807(g)(2)

KRLY-LP
Channel 300LP100 (107.9)
Alpine, California

The proposed facility meets all §73.807 minimum distance separation requirements with the exception of the following Mexican allotment records for which the instant application would be short-spaced, pursuant to §73.807(g)(2):

Facility ID	Chan. Class	Call	Location	Required distance (km)	Actual distance (km)
738170	297C1		Tijuana, BCN	73	42
95029	297B1	XHFGFM	Tijuana, BCN	45	42
95029	297B1	XHFGFM	Tijuana, BCN	45	42
738171	299B1		Tijuana, BCN	47	54

KRLY-LP's currently licensed facility was originally authorized on March 31, 2004 on file number BNPL-20000608AAAX and licensed on December 2, 2005 on file number BLL-20050606AHL. This is a first generation LPFM station that has been at the same site for nearly 17 years.

While specific public records are not available related to the original grant in respect to the protection of the 297B1 allotment at Tijuana, which the original KRLY-LP application was granted in the face of, the allotment record to upgrade the facility to C1 was accepted by the International Bureau (IB) on May 23, 2007 as a restricted allotment limited to 1.25 kW ERP and 300m or the equivalent along the azimuth of 74.75 deg in the direction of Channel 298B in El Centro, CA, and limited to 16.0 kW and 300 meters HAAT or the equivalent along the azimuth of 345.06 deg in the direction of Channel 296A at Fallbrook.¹

The allotment for Channel 299B1 at Tijuana, BCN does not appear in the 1992 US/Mexico International Agreement, but does appear in CDBS originally as a Class A allotment (which would meet distance separation requirements)² and was subsequently accepted by IB on December 2, 2008 as a Class B1 restricted allotment limited to operating with 9.5 kW and 191.75m HAAT, or the equivalent, along the 22.98 deg azimuth in the direction of Channel 299B at Twentynine Palms, CA; 9.0 kW and 191.75 m HAAT, or its equivalent, along the azimuth of 76.6 deg in the direction of Channel 298B at El Centro, CA and 0.975 kW ERP and 191.75m HAAT, or the equivalent along the azimuth of 334.51 deg in the direction of Channel 300B in San Clemente, CA.³

¹ See CDBS application IDs 291356 (marked archive), 298793 (marked archive) and 1185357 (marked current). In the fmeng table: 1185357 has a last change date of May 10, 2007, 291356 as May 23, 2007 and 298793 as May 23, 2007. None of these records have any dates in app_tracking. Facility ID 95029 has no facility status date in the CDBS facility table. In LMS raw data, Facility 738170 shows with a status date of May 10, 2007. Facility ID 95029 appears in LMS with a status date of August 6, 2019. All of these dates are subsequent to the grant of the original LPFM application.

² CDBS application ID 288372. CDBS application and app_tracking tables indicate no dates for this class A allotment. No record of this application appears in the fmcmnts table. The fm_eng_data table indicates this Class A allotment with a last change date of May 24, 2007, which is subsequent to the LPFM application.

³ This is an unusual allotment as it is reported as a Class B1 yet has two restrictions that specify operation at 9 or 9.5 kW at 191.75 meters HAAT. At 191.75 meters HAAT, the maximum ERP to reach a

In respect to the three allotment records on Channel 297 (third-adjacent channel), the licensed facility's unrounded distance is 44.4 km, which rounds to 44 km; and the proposed facility's unrounded and rounded distance is 42 km, thus creating an increase in short-spacing.

In respect to the allotment on Channel 299B1 (first-adjacent channel), the licensed facility's unrounded distance is 50.4 km, which rounds to 50 km; and the proposed facility's unrounded distance is 46.9 km, which rounds to 47 km, thus creating an increase in short-spacing.

After a discussion with Media Bureau (MB) staff, whom consulted with IB, it appears that the main concern was the 51 dBu contour of the current and proposed facility in respect to the allotment at Channel 299B1. When reviewing the directions towards Mexico, the US Mexican agreement does have provisions for reviewing all radials within 125 km of the other country. In this case, the radials in the direction of Mexico are between 98 and 231 degrees, which does take into consideration Islas Coronado, which are the islands located off of the Baja California mainland west coast.

KRLY-LP proposes to operate 50 watts ERP and utilize a Nicom BKG1P dipole antenna at an azimuth of 125 degrees.

When comparing the land area in square kilometers, we find that while the proposed 51 dBu contour does have a gain area of 28.30 square kilometers, it is offset by a loss area of 213.70 sq km, thus making this proposal result in an overall reduction of the 51 dBu interfering contour by 185.50 square kilometers.⁴ All but less than 1 square kilometer of gain area are along the radials not within 125 kilometers of the Mexican border.

KRLY-LP licensed 51 dBu interfering contour	425.80 sq km
KRLY-LP proposed 51 dBu interfering contour	240.30 sq km
Overlap between licensed and proposed contour	212.10 sq km
Gain area of proposed contour	28.20 sq km
Loss area of proposed contour	213.70 sq km
Net difference	185.50 sq km loss

We are unable to narrow this down to the area between the 98 and 231 degree radials, but the included contour maps will make it perfectly clear the amount of loss.

KRLY-LP is located in Alpine, California, an area inside of a mountain pass along Interstate 8 east of San Diego. The community population is 13,143 and the area receives an average annual daily traffic of 93,500 vehicles.⁵ As the only broadcast facility (primary or secondary,

45 km 57 dBu service contour is 6.75 kW. We will build our sample contour around 6.75 kW at 191.75m HAAT and reduce for the allotment restriction at San Clemente, California. This would mean that the 57 dBu contour towards the proposed facility would extend to 45 kilometers pursuant to the international agreement.

⁴ Based on the details of the proposed restricted allotments that were accepted by IB in 2007, we have also constructed estimated directional patterns for both the Channels 297C1 and 299B1 allotments. For the Channel 299B1 allotment, we had determined that the gain and loss areas were reduced however, even inside the 57 dBu service contour of the Channel 299B1 allotment based on the estimated directional pattern, it would still result in a substantial loss area.

⁵ Based on State of California Department of Transportation (Caltrans) Annual Traffic Census 2017 data from Interstate 8 at Tavern Road in Alpine. This figure takes into consideration both directions.

radio or television) licensed to Alpine, KRLY-LP is a true definition of community radio being the community's only local voice. Earlier this year, KRLY-LP lost their transmission site of 17 years. Due to substantial local public support, a new site was identified and offered to KRLY-LP. However, due to the events that have taken place along the border area since KRLY-LP has come on the air, it has become difficult to find a viable location to move the station to permit KRLY-LP to resume operations including Emergency Alert System.

The applicant recognizes that any request for a waiver faces a high hurdle, even at the starting gate, and that a waiver is appropriate only if special circumstances warrant a deviation from the general rule and such deviation would serve the public interest.⁶

In the instant case, KRLY-LP experienced a hardship through the loss of its site and the subsequent actions by Mexico's IFT and predecessor SCT through the accepted international notification process, which has created a hardship to be able to resume service from any viable site in a manner that would not derogate the international agreement and the IFT/SCT's prior concurrence of the currently licensed facility.

The public interest will be served by permitting KRLY-LP to resume services, including Emergency Alert System as the only broadcast facility that specifically serves Alpine, a mountain community with 13,143 persons and an interstate traffic volume of 93,000 vehicles per day.

The public interest is further served by the proposal of a directional facility that while creating a *de minimis* gain area within United States territory, it is also substantially offset by a significantly larger loss area, also entirely in the United States, which would as an overall result, reduce interference to the Mexican allotment on Channel 299B1. For Channel 297C1 at Tijuana, there is a *de minimis* net gain of 400 square meters of overlap when comparing the 100 dBu interfering contour of the authorized location and the proposed location based on allotments and no actual contour overlap based on the station's actual facility as reported by IFT.⁷

Finally, we note that the *Local Community Radio Act* of 2010 states that the Commission shall not amend its rules to reduce the co-channel, first and second-adjacent channel separation requirements between LPFM stations and full-service FM stations.⁸ REC has never interpreted

⁶ See *Northwest Cellular*, 897 F. 2d. at 1166.

⁷ While we concede and recognize that demonstration of meeting the international agreement does not allow for the use of actual facilities, we are only making this point known as it may be an additional public interest factor in the event of any negotiation with IFT as well as a factor towards the public interest prong of a waiver request. Channel 297C1 is used by XHFG, Tijuana, BCN. IFT Folio Electronico FER035396CO-105099. According to information downloaded from IFT on August 4, 2022, XHFG is operating from 32-28-42.38 N / 116-53-50.4 W at with 30 kW at 30 meters RCAGL (which we calculated as 439 meters RCAMSL) into a directional antenna. We used a nondirectional antenna in our determination as a directional antenna would only diminish service. Alpine is shielded from Tijuana due to intervening terrain. Retrieved August 4, 2022 from KML file:
http://maps.ift.org.mx/coberturasuer/coberturasV4/FM/AC/XHFG-FM_AC.kmz

⁸ Pub. L. 111-371, 124 Stat. 4072 (2011).

the definition of "full-service FM station" to also include a foreign allotment and in past application processing, the Commission appears to share the same interpretation of the law.⁹

Based on these circumstances, hardships, public interest benefits and supporting data presented, KRLY-LP is requesting a waiver of §73.807(g)(2) in respect to the distance separation towards various reserved allotments on Channels 297 and 299 at Tijuana, BCN, Mexico.

REQUEST FOR DIRECTIONAL ANTENNA HANDLING
PURSUANT TO §73.816 AND SHOWING OF
COMPLIANCE WITH §73.807(g)(5)

KRLY-LP
Channel 300LP100 (107.9)
Alpine, California

As this facility is within 125 kilometers of the common border with Mexico, it is subject to the requirements of §73.807(g)(5), which is an interpretation of Annex 1, Section 2 of the *Agreement Between The Government of the United States of America and the Government of the United Mexican States Relating to the FM Broadcasting Service in the Band 88-108 MHz (Morelia 1992)*.

§73.807(g)(5)(i) requires that LPFM stations located within 125 kilometers of the Mexican border are limited to 50 watts (0.05 kW) ERP, a 60 dBu service contour of 8.7 kilometers and a 34 dBu interfering contour of 32 kilometers in the direction of the Mexican border.¹⁰ The proposed station would operate at 50 watts (0.050 kW) ERP, pursuant to §73.811(a).¹¹

The area that is within 125 km of the Mexican border spans the arc along the radials between 98 and 231 degrees, which does take into consideration Islas Coronado, which are the islands located off of the Baja California mainland west coast.

As a nondirectional facility at 50 watts, both the 34 dbu interfering contour and the 60 dBu service contour would not meet the international agreement as they would both exceed the designated radii of 32 and 8.7 kilometers respectively.

To address this shortcoming, KRLY-LP proposes to use a Nicom BKG1P directional antenna on a bearing of 125 degrees. Based on the manufacturer's specifications for this antenna and the resulting contours based on the terrain those directions, it has been determined that the use of such an antenna would result in both a 34 dBu interfering and a 60 dBu service contour both being in compliance within the area that is within 125 km of Mexico.

Pursuant to §73.816(d)(3)(iii), as this antenna is being used solely for the purpose of meeting the international border zone distance requirements of §73.807(g), that the proof of performance and verification requirements of §73.316(c) would not apply.

DISTANCES TO 60 dBu SERVICE CONTOUR

Radials between 98 and 231 are within 125 km of Mexico.
 Distance along those radials must remain at 8.7 km or less.
 Those radials will be shaded.

Site: VFW
 Coordinates: 32-50-29.3 N, 116-47-15.4 W
 Freq: 107.90000 MHz
