KSON(FM) Channel 279B
San Diego
Auxiliary Antenna License Application

The instant application is being filed to cover construction of the KSON auxiliary antenna authorized in FCC File No. BXPB-20190719AAN. The antenna itself has been in place for over thirty years, as the licensed auxiliary antenna for stations KBZT, and then later KWFN and KXSN. Furthermore, this is a frequency-agile system used by only a single station at any given time. Therefore, the implementation of the KSON auxiliary antenna construction permit required no new construction at the site, and consequently the surveyor and engineer certifications provided herein to satisfy conditions #7 and #8 on the construction permit are taken from the 2010 license applications for the KWFN and KXSN auxiliaries.

Also included in this engineering exhibit is a detailed calculation of the RF exposure levels from the auxiliary facility, to demonstrate compliance with the applicable FCC MPE.

RE: KiFM, Facility I.D. # 34589, Permit # BXPB-20100112ABW
KSON, Facility I.D. # 30832, Permit # BXPB-20100112ABV
Affidavit Regarding Antenna Installation

The existing directional antenna proposed for use by KiFM and KSON as an auxiliary antenna (see file numbers BXPB-20100112ABW and BXPB-201000112ABV, respectively), is an existing antenna which has been used by radio station KBZT, channel 235, for many years. The existing antenna model and mounting configuration were provided to ERI for Proof of Performance for KIFM and KSON on Channel 251 (98.1 MHz) and Channel 247 (97.3 MHz), respectively. The resulting documentation provided by the antenna manufacturer corresponds with the "as-built" information provided.

Based on the review of the documentation and a physical inspection of the antenna, I certify the antenna was installed as specified in the manufacturer's instructions.

I have been a broadcast engineer for 21 years and a Chief Engineer at Noble Broadcasting, KEDJ/KGME, and Nationwide Communications prior to working for Lincoln Financial Media Company of CA. I have been involved in a couple 10-bay FM antenna installations, and a 4-bay lambda section antenna installation. I have also assisted in a 4-bay directional antenna move to accommodate a DTV antenna installation on a common tower.

R. William Eisenhamer, Jr.
Chief Engineer
Lincoln Financial Media Company of CA

***Directional Antenna System
for
KSON, San Diego, California***

November 24, 2009

Electronics Research Inc. is providing an antenna system that is specially designed to meet the FCC requirements and the general needs of radio station KSON. KSON is to be multiplexed with stations KIFM, KBZT and KYXY.

The antenna is the ERI model 1081-1CP-DA-SP configuration. The circular polarized system consists of one bay using one driven circular polarized radiating element attached to an iris enclosure. The antenna was mounted on the North 270 degrees East tower face with bracketry to provide an antenna orientation of North 300 degrees East. The antenna was tested on a self-support tower, which is the structure the station plans to use to support the array. All tests were performed on a frequency of 103.7 megahertz, which is the center of the FM broadcast channel assigned to KSON.

Pattern measurements were made on a sixty-acre antenna pattern range that is owned and operated by Electronics Research, Inc. The tests were performed under the direction of Thomas B. Silliman, president of Electronics Research, Inc. Mr. Silliman has the Bachelor of Electrical Engineering and the Master of Electrical Engineering degrees from Cornell University and is a registered professional engineer in the states of Indiana, Maryland and Minnesota.

Directional Antenna System Proposed For KSON, San Diego, California

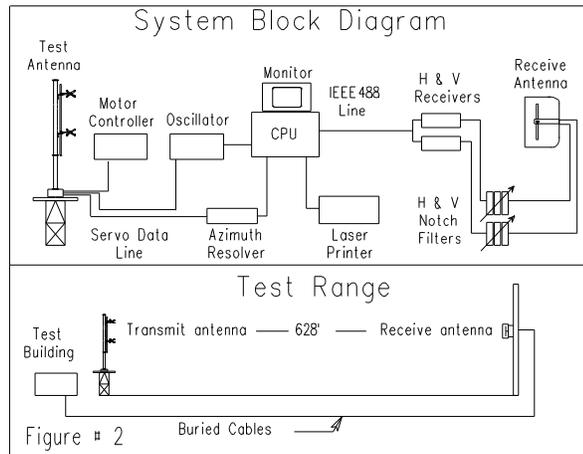

(Continued)

DESCRIPTION OF THE TEST PROCEDURE

The test antenna consisted of a full-scale model of the complete circular polarized system. The elements and brackets that were used in this test are electrically equivalent to those that will be supplied with the antenna.

The power distribution and phase relationship to the antenna elements was adjusted in order to achieve the directional radiation patterns for both horizontal and vertical polarization components.

The proof-of-performance was accomplished using a self support tower with identical dimension and configuration including all braces, ladders, conduits, coaxial lines and other appurtenances that are included in the actual aperture at which the antenna will be installed. The structure was erected vertically on a turntable mounted on a non-metallic building with the antenna centered vertically on the structure, making the center of radiation of the test

approximately 30 feet above ground. The turntable is equipped with a motor drive and a US Digital angle position indicator. The resolution of this angle position indicator is one-hundredth of a degree.

The antenna under test was operated in the transmitting mode and fed from a HP8657D signal generator. The frequency of the signal source was set at 103.7 MHz and was constantly monitored by a Rohde & Schwarz ESVD measuring receiver.

A broadband horizontal and vertical dipole system, located approximately 628 feet from the test antenna, was used to receive the emitted test signals. The dipole system was mounted at the same height above terrain as the center of the antenna under test. The signals received by the dipole system were fed to the test building by way of two buried Heliax cables to a Rohde & Schwarz measuring receiver.

Directional Antenna System
Proposed For
KSON, San Diego, California

(Continued)

This data was interfaced to a laser jet printer by means of a computer system. Relative field strength was plotted as a function of azimuth.

The measurements were performed by rotating the test antenna in a counter-clockwise direction and plotting the received signal on polar coordinated graph paper in a clockwise direction. Both horizontal and vertical components were recorded separately.

CONCLUSIONS

The circular polarized system consists of one bay using one driven circular polarized radiating element attached to an iris enclosure. The power distribution and phase relationship will be fixed when antenna is manufactured. Proper maintenance of the elements should be all that is required to maintain the pattern in adjustment.

The 1081-1CP-DA-SP array is to be mounted on the North 270 degrees East tower face of the self-support tower at a bearing of North 300 degrees East. Blue prints provided with the antenna will show the proper antenna orientation alignment. The antenna alignment procedure should be directed by a licensed surveyor as prescribed by the FCC.

Figure #1 represents the measured individual horizontal and vertical components, the composite maximum of either the horizontal or vertical component at any azimuth and the FCC filed envelope pattern. The horizontal plane relative field list for the composite pattern and the individual H & V components are shown as Figure #1 & 1A respectively. The actual measured pattern does not exceed the authorized FCC composite pattern at any azimuth. A calculated vertical plane relative field pattern is shown on Figure #3 attached. The power in the maximum will reach 1.800 kilowatts (2.553 dBk).

The RMS of the vertically polarized horizontal plane component does not exceed the RMS of the horizontally polarized horizontal plane component.

The composite horizontal and vertical maximum relative field pattern obtained from the measured data as shown on Figure #1 has an RMS that is greater than 85% of the filed composite pattern.

The clear vertical length of the structure required to support the antenna is 20 feet.

Directional Antenna System
Proposed For
KSON, San Diego, California

(Continued)

The directional antenna should not be mounted on the top of an antenna tower that includes a top-mounted platform larger than the cross-sectional area of the tower in the horizontal plane. No obstructions other than those that are specified by the blue prints supplied with the antenna are to be mounted within 75 ft. horizontally of the system. The vertical distance to the nearest obstruction should be a minimum of 10 ft. from the directional antenna. Metallic guy wires should be a minimum distance of forty feet horizontally from the antenna.

Auxiliary Antenna RF Exposure Study

Background

The construction permit for the KSON auxiliary antenna (FCC File No. BXPB-20190719AAN) bears a condition requiring the performance of radiofrequency electromagnetic field strength measurements throughout the transmitter site area to determine if there are any areas that exceed the FCC guidelines for human exposure. In lieu of measurements, this report presents a set of detailed calculations which demonstrate compliance with the FCC guidelines.

The construction permit authorizes KSON to utilize, as an auxiliary facility, an existing ERI model 1081-1CP-DA-SP broadband panel antenna (single panel) which is installed on a tower at the San Miguel Mountain transmitter site. This antenna is or will be used as a frequency-agile¹ auxiliary facility by the following stations:

KWFN	247B	0.65 kW	BXLH-20100325ABH
KBZT	235B	2.6 kW	BXLH-19881011KB
KXSN	251B	1.5 kW	BXLH-20100325ABF
KSON	279B	1.8 kW	BXPB-20190719AAN
KYXY	243B	2.5 kW	BXPB-20190719AAM

Previous authorization of the auxiliary facilities already licensed to operate from this antenna system has relied on detailed calculations to demonstrate compliance with the FCC guidelines for human exposure.² Those calculations were performed using the equation shown below from OET Bulletin No. 65, and have taken into account both the manufacturer's azimuth and elevation patterns for the antenna, as well as the height of the antenna above the actual terrain elevations surrounding the tower. The following study repeats those calculations for the KSON auxiliary facility.

¹Since no combiner is installed, the antenna system can be used by only one station at any given time.

²See, for example, the Consolidated Engineering Statement in the KXSN auxiliary facility application for construction permit, FCC File No. BXPB-20100112ABW, granted January 21, 2010.

Controlled/Occupational Site

The transmitter site is located on a remote peak of San Miguel Mountain. According to information provided by the applicant, access to the transmitter site is controlled by a large, locked gate with warning signs posted more than two miles down the road from the transmitter site. This road is the only road which accesses the transmitter site, which rises 1600 feet above the location of the gate. Additionally, a fence surrounds the transmitter site itself, with additional warning signs posted. Based on this information, it is believed that this site qualifies as a controlled access site, and the following calculations are therefore based on the controlled/occupational Maximum Permissible Exposure (MPE) limits.

Calculations

The power density calculations shown below were made using the techniques outlined in OET Bulletin No. 65. "Ground level" calculations in this report have been made at a reference height of 2 meters above ground to provide a worst-case estimate of exposure for persons standing on the ground in the vicinity of the tower. The equation shown below was used to calculate the ground level power density figures from each antenna.

$$S(\mu W / cm^2) = \frac{33.40981 \times AdjERP(Watts)}{D^2}$$

Where: *AdjERP(Watts)* is the maximum lobe effective radiated power times the element pattern factor times the array pattern factor.

D is the distance in meters from the center of radiation to the calculation point.

Generally speaking, the terrain falls steeply away from the tower site in all directions, with the exception of a small rise immediately east of the tower, beyond which the terrain again falls away. Calculations were made at incremental distances from the tower along each of eighteen radials (every 20 degrees of arc), out to a distance of 100 meters. Beyond this point, the terrain continues to slope away and the calculated exposure levels from the subject antenna have fallen below (and remain below) 5% of the applicable MPE. Terrain elevations were read from the USGS 7.5 minute topographic map, and entered into a spreadsheet which uses the OET 65 equation above, along with the relative field values from the manufacturer's azimuth and elevation patterns, to calculate the ground-level power density for an individual standing at the recorded point elevation.

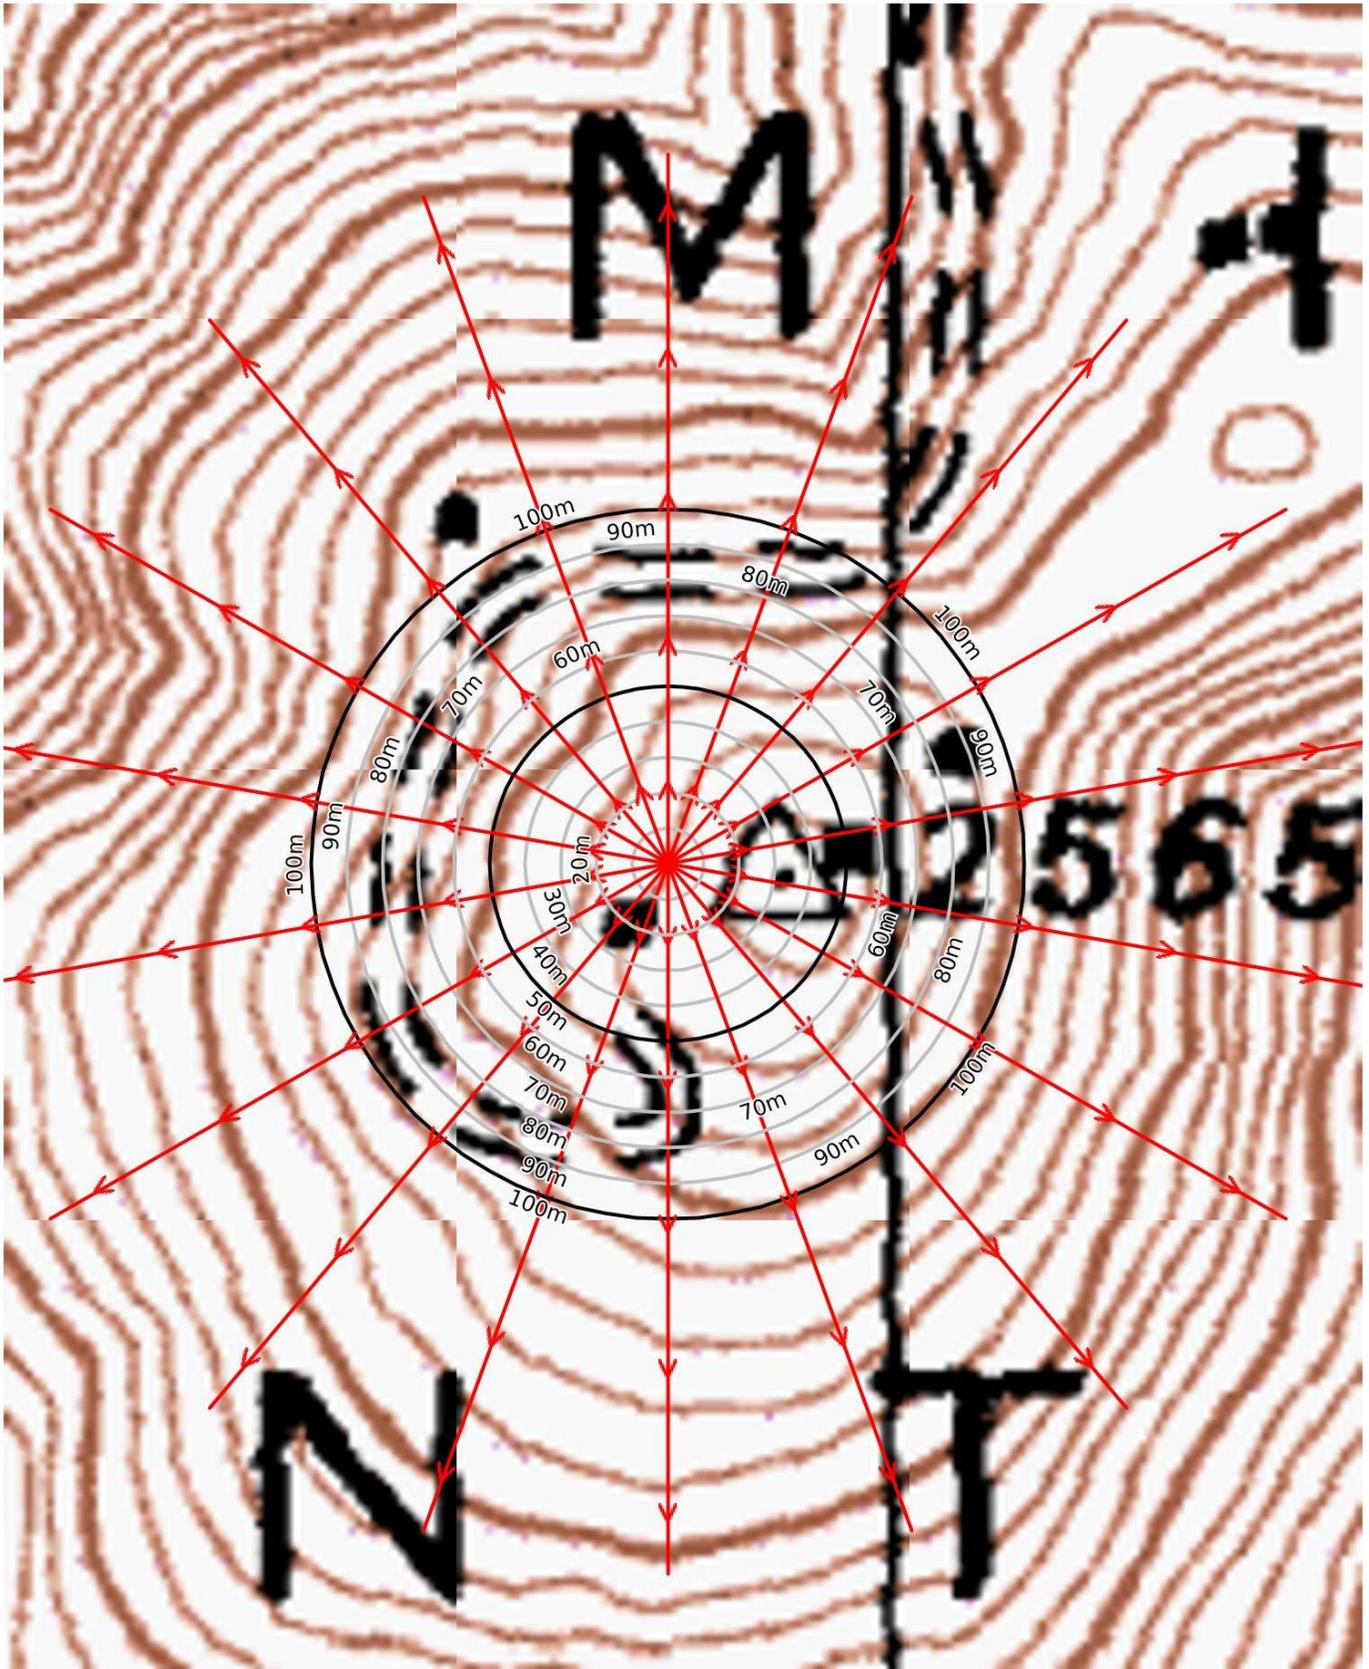

These calculations, detailed on the following pages, show that the maximum calculated power density produced at two meters above ground level by the proposed operation of the KSON auxiliary facility is $22.9 \mu\text{W}/\text{cm}^2$, which is 2.3% of $1000 \mu\text{W}/\text{cm}^2$ (the FCC standard for controlled environments).

These calculations show that the maximum calculated power density produced at two meters above ground level by the proposed operation alone is less than 5% of the applicable FCC exposure limit. Section 1.1307 of the Commission's Rules exempts applications for new facilities or modifications to existing facilities from the requirement of preparing an environmental assessment when the calculated emissions from the applicant's proposed facility are predicted to be less than 5% of the applicable FCC exposure limit. Therefore, the proposed facility is in compliance with Section 1.1301 *et seq* and no further analysis of RF exposure at this site is required in this application.

The permittee/licensee in coordination with other users of the site must reduce power or cease operation as necessary to protect persons having access to the site, tower or antenna from radiofrequency exposure in excess of FCC guidelines.

KSON 279B San Diego
Ground-Level Power Density Calculations
 Using Manufacturer's Vertical Plane Pattern, Horizontal Plane Pattern, and Terrain from 7.5 minute topo

Bearing: 100 degrees True
 H Relative Field: 0.087
 V Relative Field: 0.052
 Main Lobe ERP: 1800 watts

Antenna: ERI 1081-1CP-DA-SP
 ERP: 14 watts H, 5 watts V
 Antenna AGL (at base): 30 meters
 Antenna AMSL: 806 meters
 MBT: 0 degrees

Calculated Maximum is 0.3 uW/cm² at 25 meters from the tower

KSON 279B San Diego
Ground-Level Power Density Calculations
 Using Manufacturer's Vertical Plane Pattern, Horizontal Plane Pattern, and Terrain from 7.5 minute topo

Distance From Tower (meters)	Terrain AMSL from topo map (feet)	Antenna height above 2 meter person at terrain point (meters)	Hypotenuse (meters)	Depression Angle (with MBT adjust) (degrees)	Interpolated Rel Field	Adjusted ERP (watts)	Power Density uW/cm ²

Ground-Level Power Density Calculations
 Using Manufacturer's Vertical Plane Pattern, Horizontal Plane Pattern, and Terrain from 7.5 minute topo

Bearing: 240 degrees True
 H Relative Field: 0.525
 V Relative Field: 0.557
 Main Lobe ERP: 1800 watts

Antenna: ERI 1081-1CP-DA-SP
 ERP: 496 watts H
 558 watts V
 Antenna AGL (at base): 30 meters
 Antenna AMSL: 806 meters
 MBT: 0 degrees

Calculated Maximum is 7.8 uW/cm² at 25 meters from the tower

KSON 279B San Diego
Ground-Level Power Density Calculations
 Using Manufacturer's Vertical Plane Pattern, Horizontal Plane Pattern, and Terrain from 7.5 minute topo

Distance From Tower (meters)	Terrain AMSL from topo map (feet)	Antenna height above 2 meter person at terrain point (meters)	Hypotenuse (meters)	Depression Angle (with MBT adjust) (degrees)	Interpolated Rel Field	Adjusted ERP (watts)	Power Density uW/cm ²
