

Reason for Engineering STA

KRCY-FM is currently licensed to operate on the top of Crossman Peak at 260W. The power at the facility is provided by a diesel-powered generator. The generator has been malfunctioning for many months resulting in intermittent periods of silence to KRCY-FM. Applicant is requesting a temporary reduction of power at a different location with a different antenna system. The proposed engineering site is powered by a solar-battery system. The public interest will be served by keeping the station on the air. The station is expected to return to normal operations within six months.
