

To Whom It May Concern

10/18/2022

The construction for the modification for K239CT to move from channel 239 to channel 231 has been completed. The station has been built according to its construction permit, with a Shively 6812 2 bay half-wave spaced antenna at the appointed coordinates and height specified within the construction permit (application number 0000189377). Due to the length of the transmission line and 2 bay half-wave spaced Shively 6812 antenna the transmitter power output is 475 watts. K231DK is using an Elenos ETG 500 to achieve the 475 watts necessary for an ERP of 250 watts.

I, Scottie Rice, Have been a broadcast engineer for more than 20 years, and certify that this facility has been built to the necessary specifications to achieve the licensed signal for K231DK.

Sincerely
