

## Second Adjacent Waiver

The signal strengths of the second adjacent channels at the proposed site for KHTQ and KPND are 84.4 dBu and 83.3 dBu. Interference will occur at +40 db, or the 123.3 (83.3+40) dBu interference contour. The 123.3 dBu contour is plotted below, with zero population within that area. Due to zero population to this area, this request meets the precedent for previous 2nd adjacent channel waivers granted.
