

RFR Statement of Compliance

Based on the FCC's *FM Model* program, which considers the specific antenna type and predicts the power density at two meters above ground level, the proposed ERI LPX Series, four-bay, one-half wavelength spaced antenna (EPA Type 3) operating as proposed herein is predicted to produce a maximum worst-case power density of $0.49 \mu\text{W}/\text{cm}^2$ at two meters above ground level. This represents 0.25% of the FCC guideline value for uncontrolled RFR environments. Pursuant to Section 1.1307(b)(3) of the FCC rules, the proposal's power density contribution is insignificant.

Further, the applicant is committed to reducing power and/or ceasing operation during times of service or maintenance of the transmission systems as necessary to avoid potentially harmful exposure to personnel. In light of the above, the proposed facility should be categorically excluded from RF environmental processing under section 1.1307(b) of the commission's rules.
