Quality Broadcast Antenna Systems

**Directional FM Antenna
KGZG-FM
Radio Station KMJY, LLC
Newport, WA**

A custom designed 3-element Yagi type antenna with parasitic element was used in conjunction with the customer's Stainless 25G tower to create the necessary directional radiation pattern. The final antenna consists of 4-bays of radiating elements spaced .84-wavelengths mounted directly to the tower leg with one horizontal parasitic element per bay.

Pattern testing was performed using a 1/3 scale model element and tower. The azimuth plane measurements were taken on a ground reflection test range. This type of test range utilizes the reflected signal and direct signal from the source antenna to form an interference pattern on the antenna under test. The antenna and tower under test was mounted to a turntable that allowed the structure to be rotated 360° in the azimuth plane. The source antenna was located approximately 75 ft. from the antenna under test. The source height above ground was adjusted to peak the first lobe of the interference pattern at the antenna under test.

The test antenna was mounted in the center of rotation of the turntable. The antenna and tower were rotated clockwise while data was recorded in a counter clockwise direction. All feed cables to the antenna were secured and grounded during pattern measurements. A Hewlett Packard 8753E-network analyzer operating at 313.5 MHz was used as both the source and receiver. The level of the received signal was compared with a standard dipole to establish the directivity of the final pattern. The final pattern measured does not exceed the envelope pattern.

The antenna is to be mounted 29 meters (95.1 ft.) +2/-4 meters above ground level on the southeast tower leg and positioned 95° True. No other antenna can be installed within 15 ft. of the antenna element. It is recommended that a broadcast engineer be present to supervise the installation of the antenna and that he or she certifies that the antenna has been installed according to the enclosed instructions.

An input power level of 6.56 kW will be required at the antenna input in order to reach the approved 87 kW ERP. The transmitter output power requirements are dependent upon the transmission line size and length used to feed the antenna.

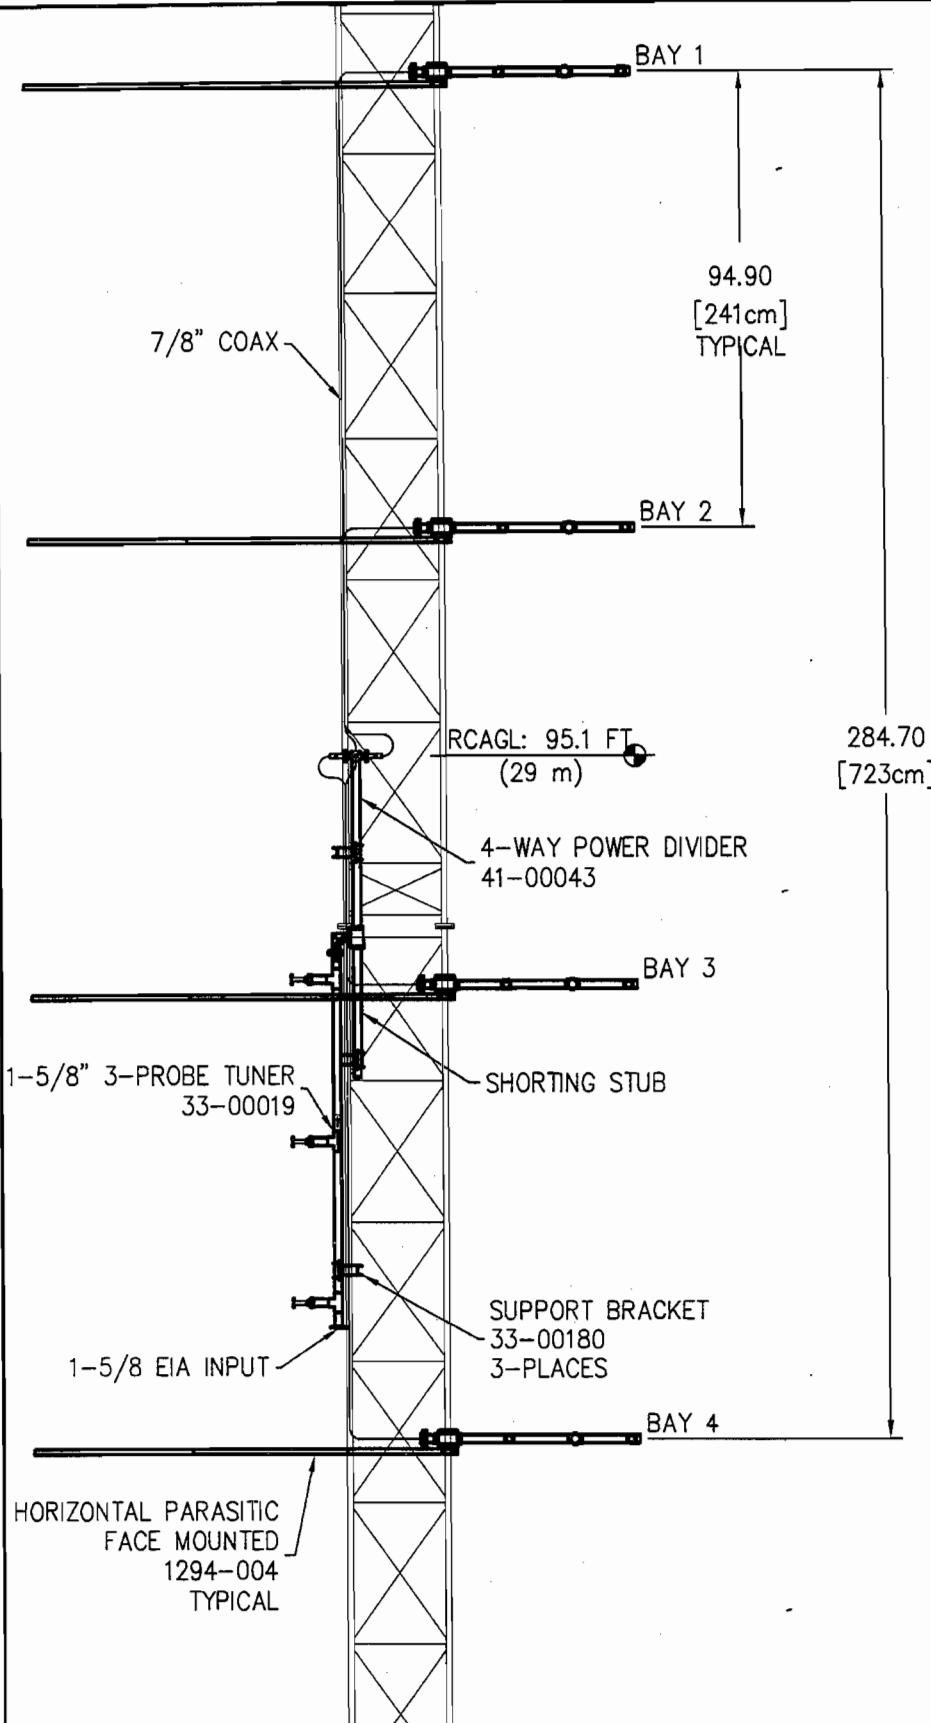

Antenna Specifications

Antenna Model	PSIFM3HY-4-DA
Type	4-bay directional FM Yagi antenna
Frequency	104.5 MHz
Polarization	Horizontal
Envelope RMS	.883
Measured RMS	.454
Gain	13.27 (11.23 dB)
ERP	87 kW
Antenna input power	6.56 kW
Antenna Input	1-5/8" EIA
Power rating	10 kW
Length	23.73 ft.
Weight	153 lbs.
Wind Area	19.41 sq. ft.

Statement of Certification

This is to certify the antenna has been designed, fabricated and tested under my supervision and it meets the required envelope pattern limitations set forth in the stations construction permit.
