

TECHNICAL EXHIBIT  
APPLICATION FOR DTV CONSTRUCTION PERMIT  
IN SUPPORT OF ITS POST-TRANSITION FACILITY  
STATION KBMY(DT)  
BISMARCK, NORTH DAKOTA  
CH 16 94.5 KW (MAX-DA) 290 M

Technical Narrative

This Technical Exhibit supports an application for digital television (DTV) station KBMY(DT) for its final DTV at Bismarck, North Dakota. This application requests a construction permit (CP) for a digital television operation on KBMY(DT)'s current DTV channel 16 at Bismarck with an ERI AL12M-16-PM directional antenna and an effective radiated power (ERP) of 94.5 kilowatts.

Proposed Facilities

Station KBMY(DT) proposes to operate on DTV channel 16 from its licensed NTSC (analog) transmitter site. The antenna height above average terrain for the channel 16 DTV operation is 290 meters. The proposed directional ERP level of 94.5 kilowatts will not result in the herein proposed noise-limited contour extending beyond its current FCC approved *Appendix B* allocated maximum effective radiated power in any azimuthal direction.<sup>1</sup>

---

<sup>1</sup> See Seventh Report And Order And Eighth Further Notice Of Proposed Rule Making in the Matter of Advanced Television Systems and their Impact Upon the Existing Television Broadcast Service, MB Docket 87-268, Released August 6, 2007; Adopted August 1, 2007.

The proposed DTV transmitter site will be located at its licensed NTSC transmitter site. Therefore, the proposed site location is:

46° 35' 15" North Latitude  
100° 48' 20" West Longitude

A sketch of antenna and pertinent elevations are included as Figure 2.

The Appendix contains the vertical and horizontal plane radiation patterns for the proposed antenna system.

Figure 3 is a map showing the DTV predicted coverage contour and the associated *Appendix B* noise-limited coverage contour. The extent of the contour has been calculated using the normal FCC prediction method. The Bismarck city limits were derived from information contained in the 2000 U.S. Census of Population and Housing.

#### Population Served

The herein proposed KBMY(DT) facility is predicted to serve 104,730 persons, post-transition based upon the 2000 Census.

---

Allocation Considerations

The proposed KBMY(DT) Channel 16 facility meets the requirements of Section 73.623 of the FCC Rules concerning predicted interference to other Appendix B DTV allotments. Longley-Rice interference analyses were conducted pursuant to the requirements of the FCC Rules; OET Bulletin No. 69; and published FCC guidelines for preparation of such interference analyses. The Longley-Rice interference analyses were conducted using the software developed by du Treil, Lundin & Rackley, Inc. based on the FCC published software routines.<sup>2</sup> Stations selected for analysis were determined pursuant to the distance requirements outlined in the FCC DTV Processing Guidelines Public Notice. The results of the interference analyses for the proposed KBMY(DT) facility are summarized herein at Figure 4. As indicated therein, the proposed facility will meet the 0.5% criterion outlined in the FCC Rules and published guidelines with respect to all considered stations.<sup>3</sup>

Radiofrequency Electromagnetic Field Exposure

The proposed KBMY(DT) facilities were evaluated in terms of potential radiofrequency electromagnetic field exposure at ground level to workers and the general public. The radiation center for the proposed KBMY(DT) antenna is

---

<sup>2</sup> The duTreil, Lundin & Rackley, Inc. DTV interference analysis program is based on the program and procedures outlined by the FCC in the Sixth Report and Order; subsequent Memorandum Opinion and Order; and FCC OET Bulletin No. 69. A nominal grid size resolution of 2 km was employed with 1.0 km terrain increment.

<sup>3</sup> Interference analysis results reflect the net change in interference to a given station considering the interference predicted to occur from all other stations (i.e. "masking") including the allotment facility

located 187 meters above ground level. The maximum effective radiated power is 94.5 kilowatts. A "worst-case" relative field value of 0.25 is assumed for the antenna's downward radiation. The calculated power density at a point 2 meters above ground level is 0.006 mW/cm<sup>2</sup>. This is less than 5 percent of the Commission's recommended limit of 0.32 mW/cm<sup>2</sup> for channel 16 for an "uncontrolled" environment.

Access to the transmitting site is restricted and appropriately marked with warning signs. As this will be a multi-user site an agreement between the stations will control access. In the event that workers or other authorized personnel enter restricted areas or climb the tower, appropriate measures will be taken to assure worker safety with respect to radio frequency radiation exposure. Such measures include reducing the average exposure by spreading out the work over a longer period of time, wearing "accepted" RFR protective clothing and/or RFR exposure monitors or scheduling work when the stations are at reduced power or shut down.

---

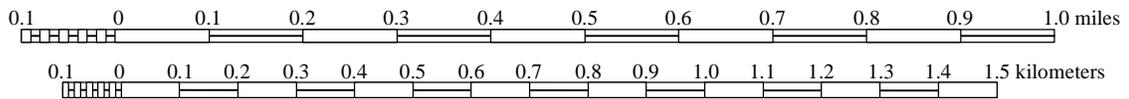

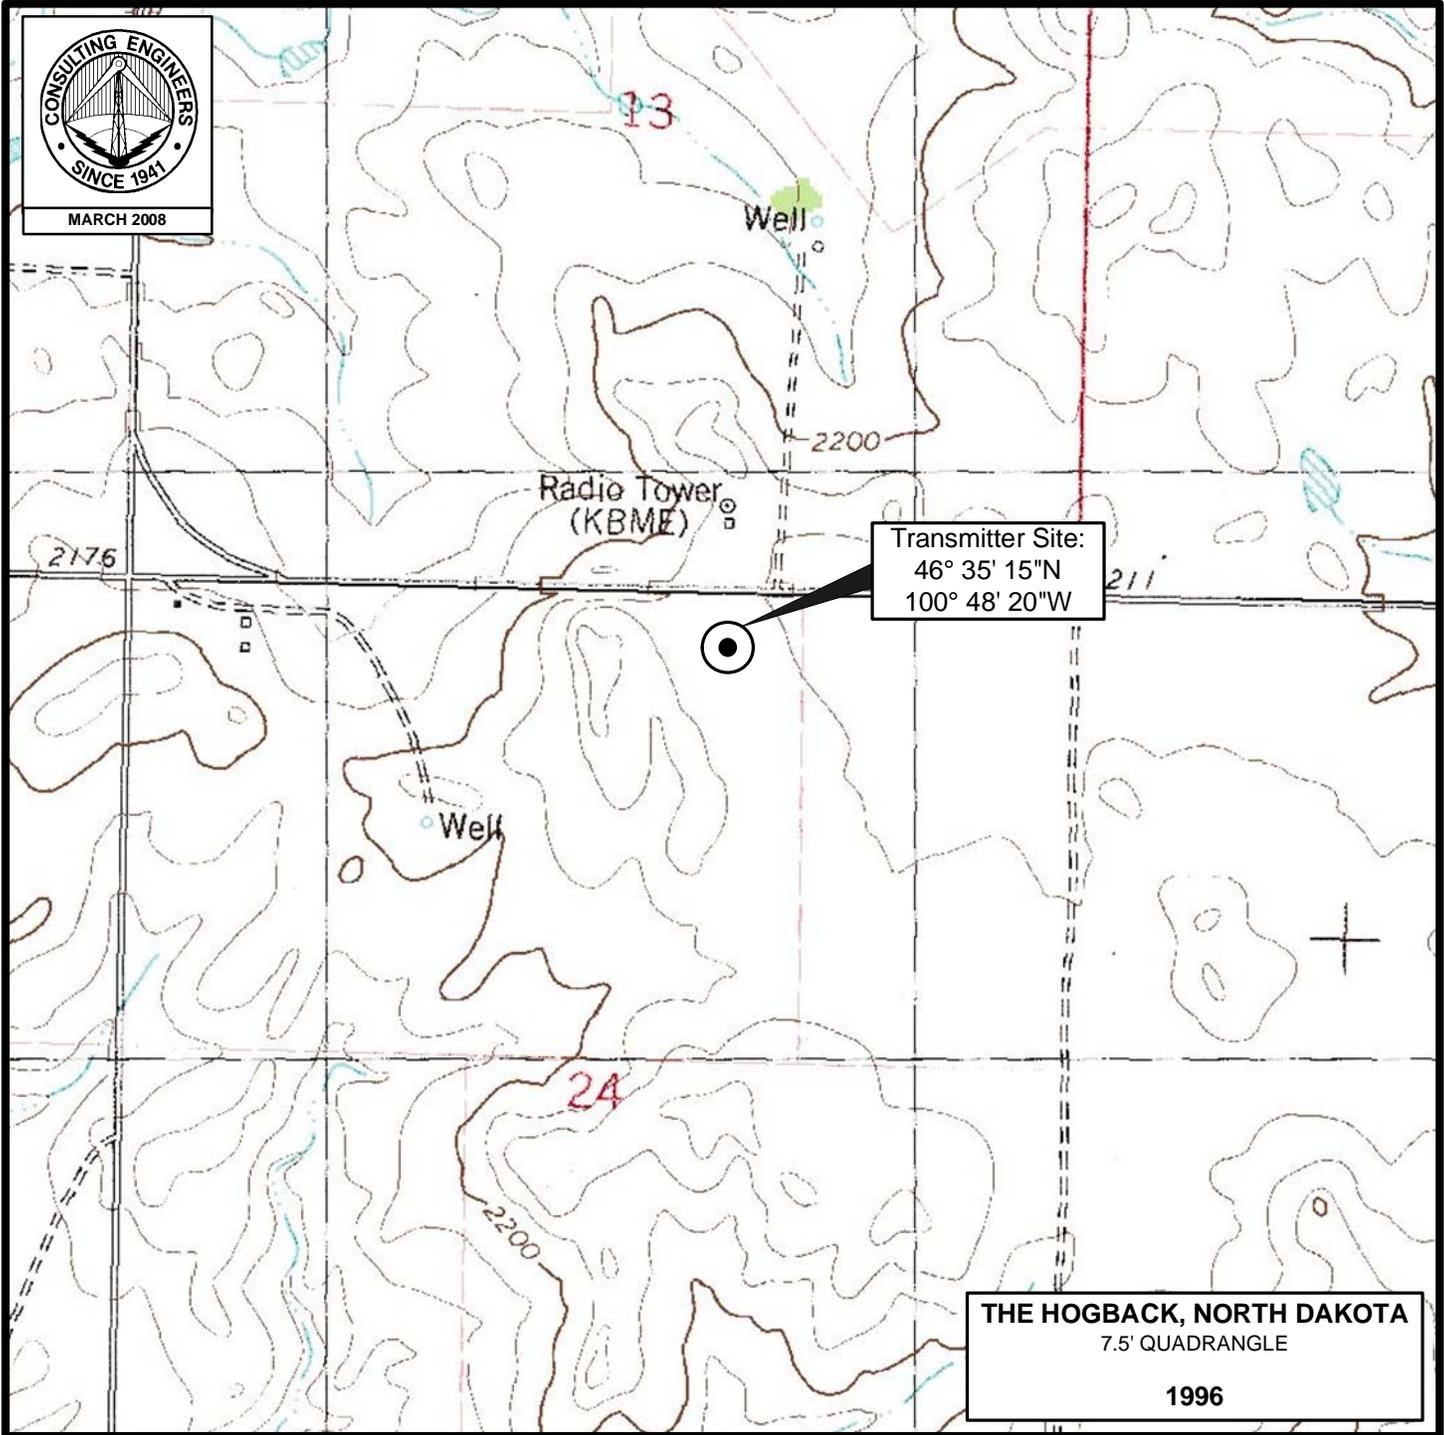

It is noted that this statement only addresses the potential for radiofrequency electromagnetic field exposure. All other aspects of the environmental processing analysis will be or already have been provided to the FCC by the tower owner.
