

TECHNICAL EXHIBIT
APPLICATION FOR CONSTRUCTION PERMIT
LPTV STATION W16BS
FACILITY ID 67976
SHEBOYGEN, WISCONSIN
CH 29 50 KW (MAX-DA)

Technical Narrative

The technical exhibit of which this narrative is part was prepared in support of a displacement relief application for LPTV station W16BS at Sheboygan, Wisconsin (Facility ID: 67976). Station W16BS is currently licensed (BLTT-20000802AEH) to operate on channel 16 (482-488 MHz) with a "plus" carrier frequency offset, a directional antenna maximum effective radiated power of 11.2 kilowatts (kW) and an antenna radiation center height above mean sea level (RCAMSL) of 296 meters. An Andrew model ALP16L2-HSW directional antenna is employed with a main lobe orientation of 280 degrees true.

Displacement Relief Eligibility

The KTFB-CA currently licensed facility on channel 16 is located 170 kilometers from the licensed, co-channel facility of full-power DTV station WTVO on channel 16 at Rockford, IL (BLCDT-20021024AAS). According to Section 73.3572(a)(4)(iii) and 73.3572(a)(4)(iv)(A)(1) of FCC's rules, a LPTV station is eligible for displacement relief if it is located within 265 km from the coordinates of a co-channel DTV authorization or DTV allotment. Therefore, LPTV station W16BS is eligible for displacement relief.

In addition, W16BS can no longer broadcast from their current site location, as the land that the site is located has been sold and the tower is being removed. Thus, it is also proposed to operate W16S on channel 29 from a new transmitter site located 25.2 kilometers south-southwest of the current W16BS site. It is noted that the proposed site is located less than 48 kilometers (30 miles) from W16BS's currently licensed site. In addition, there will be overlap of the current and proposed 74 dBu contours as detailed below. Therefore, based on current FCC policy, a displacement relief application specifying a site change of less than 48 kilometers (30 miles) and also involving 74 dBu contour overlap is considered permissible.

Figure 1 depicts the licensed and herein proposed 74 dBu contours for W16BS. As indicated, the proposed 74 dBu contour overlaps a portion of the licensed 74 dBu contour.

Proposed Facilities

It is proposed to operate on channel 29 (560-566 MHz) employing an Antenna Concepts ACS24BR composite wide cardioid directional antenna having a main lobe orientation of 110 degrees true. The maximum ERP at the radio horizon as well as at any horizontal or vertical angle will be 50 kW and the antenna radiation center above mean sea level will be 320 meters.

Antenna Structure Registration

It is proposed to side-mount the directional antenna at the 60.3 meter level on an existing 102.7 meter supporting structure (Antenna Structure Registration Number 1213322).

Response to Paragraph 13 (Interference)

The proposed facility complies with all the following applicable rule Sections: Sections 74.705, 74.706, 74.707, 74.708, 74.709 and 73.710. Figure 2 provides the output of a study based on the OET-69 Bulletin which demonstrates that the proposed W16BS operation complies with the FCC's NTSC, DTV, LPTV/TV translator and Class A interference criteria¹.

Environmental Considerations

The proposed W16BS LPTV facilities were evaluated in terms of potential radiofrequency radiation exposure at ground level in accordance with OST Bulletin No. 65, "Evaluating Compliance With FCC-Specified Guidelines for Human Exposure to

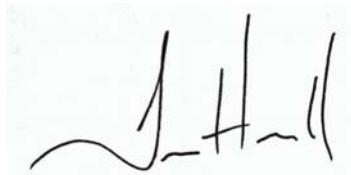

¹ The du Treil, Lundin & Rackley, Inc. DTV interference analysis program is based on the program and procedures outlined by the FCC in the Sixth Report and Order; subsequent Memorandum Opinion and Order; and FCC OET Bulletin No. 69. A nominal grid size resolution of 1 km was employed. A Sun computer system was employed. The results have been found to be in agreement with the results of the FCC implementation of OET Bulletin 69.

Radiofrequency Radiation". The calculated power density at the base of the tower was calculated using the appropriate equation of the Bulletin.

Figure 3 depicts the vertical pattern data for the proposed directional antenna. Using a greater than expected vertical plane relative field value of 0.2 at depression angles towards the tower base (-60° to -90° elevation), a peak visual effective radiated power of 50 kW, 10 percent aural power, and an antenna center of radiation height above ground level of 60.3 meters, the calculated power density at 2 meters above ground level at the base of the tower is 0.0099 milliwatts per square centimeter (mW/cm^2), or 2.65 percent of the Commission's recommended limit of 0.38 mW/cm^2 for TV channel 29 applicable to general population/uncontrolled exposure areas.

Access to the transmitting site will be restricted and appropriately marked with warning signs. Furthermore, as this is a multi-user site, an agreement will be in place to ensure that appropriate measures will be taken to assure worker safety with respect to radio frequency radiation exposure. Such measures include reducing the average exposure by spreading out the work over a longer period of time, wearing "accepted" RFR protective clothing and/or RFR exposure monitors or scheduling work when the stations are at reduced power or shut down.

Finally, it is noted that this technical exhibit only addresses the potential for radiofrequency electromagnetic field exposure. All other aspects of the environmental processing analysis will be or already has been provided to the FCC by the tower owner.

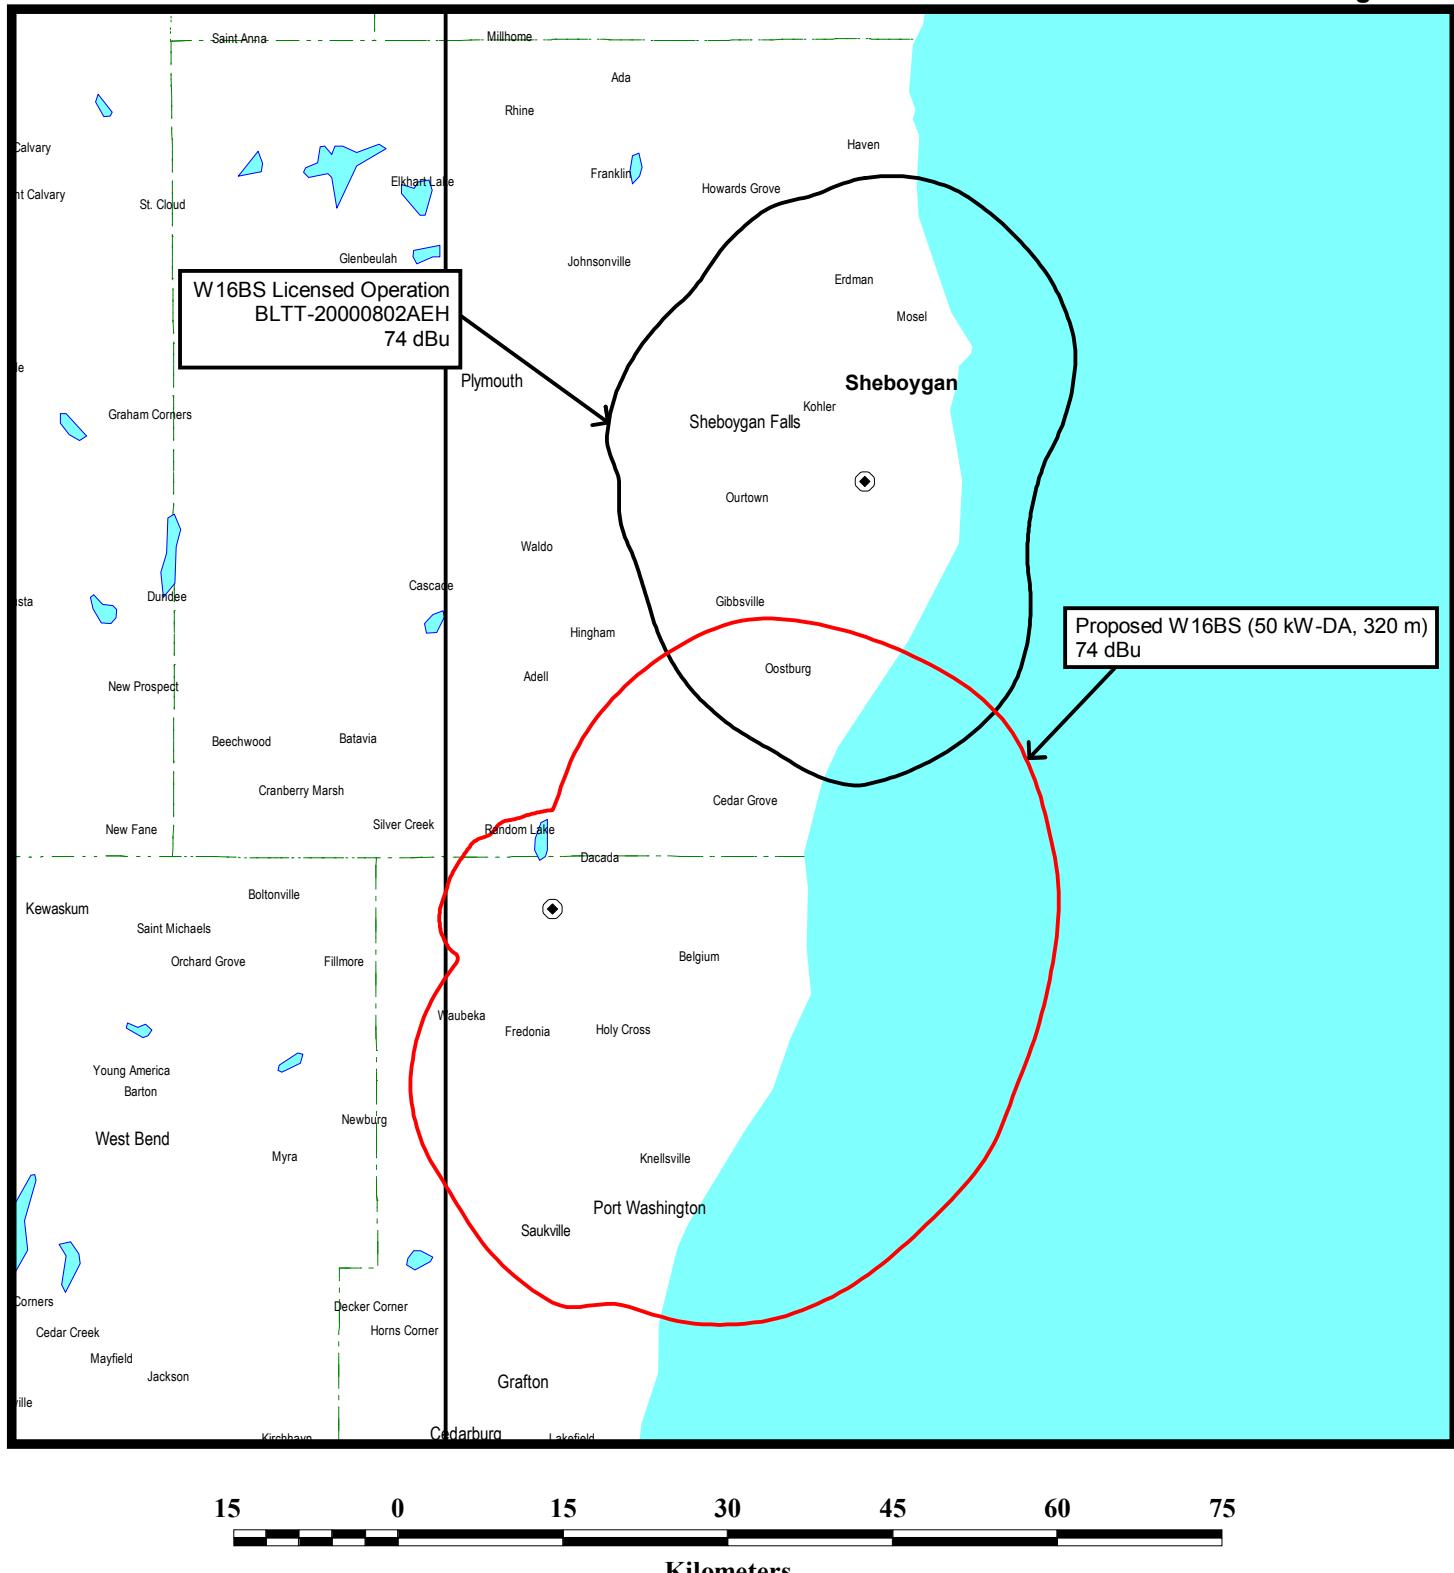

A handwritten signature in black ink, appearing to read "Thomas J. Howell".
