

**EXHIBIT 43
ENVIRONMENTAL STATEMENT
KSNW-DT 891 KW 312.2 M HAAT CH. 45
WICHITA, KANSAS**

The applicant, Emmis Television License, LLC, requests authority to modify its outstanding construction permit for digital television (DTV) station KSNW-DT, Channel 45, Wichita, Kansas for a reduction in effective radiated power (ERP). The applicant is also correcting the site coordinates and ASR information for antenna supporting structure referenced on the underlying construction permit, FCC File No. BMPCDT-20030930BCK. The instant request for minor modification of construction permit is categorically excluded from environmental processing by Section 1.1306 of the Commission's rules since the specified antenna structure (ASRN 1244913) is an existing tower and the safety standards for human exposure to radio-frequency (RF) energy in Section 1.1307(b) will not be exceeded as described below.

The DTV Channel 45 facility of KSNW-DT will not result in RF contributions exceeding the *RF Radiation Exposure Limits* specified in Section 1.1310 of the Commission's rules. The specified modification involves a Dielectric Model TFU-30GTH-R-04 nondirectional antenna that will be positioned 318 meters above ground level (AGL). This horizontally polarized antenna will have 0.75 degree of electrical beam tilt and effective radiated power (ERP) at the main beam elevation will be 891 kW. The maximum permissible exposure (MPE) limits for Channel 45, at the bottom frequency of 656 MHz, are 437.33 $\mu\text{W}/\text{cm}^2$ for general (uncontrolled) exposure and 2,186.67 $\mu\text{W}/\text{cm}^2$ for occupational (controlled) exposure. Compliance with these limits was established based on a "worst case" estimation of ground level power density using the EPA prediction method adopted by the Commission.

The “worst case” power density level accessible at two meters above ground as a result of the KSNW-DT facility modification is calculated to be 2.98 $\mu\text{W}/\text{cm}^2$. In reference to the manufacturer’s elevation pattern and tabulation attached as Figures 1 and 2, the antenna relative field does not exceed 0.1 at any angle greater than 10° below the horizontal. Therefore, an antenna relative field value of 0.1 was assumed in determining the above worst case scenario. Since the estimated contribution for the KSNW-DT facility is less than 5% of both the uncontrolled and controlled MPE guidelines, the applicant is not required to further evaluate the antenna location with respect other RF contributors.

It has been demonstrated that the proposal complies with the occupational exposure limit at any ground-level location. At higher elevations on the antenna structure, however, all site users will be protected from excessive exposure to RF fields in accordance with the methods recommended in *OET Bulletin No. 65, Version 97-01*, which includes scheduling tower work in coordination with periods of reduced power operation or while the facility is shut down.

Respectfully submitted,

LOHNES AND CULVER
