

**ENGINEERING STATEMENT**  
**PREPARED IN SUPPORT OF**  
**REQUEST FOR SPECIAL TEMPORARY AUTHORITY**  
**KXEN 1010 kHz 0.125/0.35 kW ND-U ST. LOUIS, MISSOURI**

**FEBRUARY 2020**

The following engineering statement has been prepared on behalf of BDJ Radio Enterprises, LLC (“**BDJ**”), licensee of Class B standard broadcast station **KXEN**, FCC ID Number 54739, St. Louis, Missouri. **KXEN** is licensed for full time, 50 kW day and 0.5 kW night, operation on 1010 kHz. The need for the STA facilities is described in the STA application, Exhibit 16.

**KXEN** proposes to operate day and night utilizing the temporary wire antenna mounted on the side of the self- supporting tower located at the studios of **KDNL TV** in downtown St. Louis, Missouri. The tower carries FCC tower registration number 1003524. The **KDNL** site is located 18.4 kilometers southwest of the **KXEN** licensed site which places the STA facility both within the community of license and more central to the major lobe of the daytime directional antenna pattern.

An STA for use of the **KDNL** site is herein requested based on the following parameters:

Frequency (kHz):	1010
North Latitude:	38° 38' 09"
West Longitude:	90° 11' 45"
(NAD 27)	
Tower Registration Number:	1003524
Power Day:	0.35 kW
Night:	0.125 kW

Radiator Height:	74.2-meter vertical wire supported on face of self-supporting tower with two shorter wires below radiator as a counterpoise. All wires totally insulated from the tower
------------------	---

(See Figure 3)

90 degrees

Theoretical efficiency: 305.0 mV/m @ 1 km for 1 kW

It is noted that the proposed STA tower and site, although existing, are not suitable for **KXEN** licensed operation as the omni antenna configuration is unable to provide the required nighttime protection to existing facilities at a power level which would allow continued fulltime Class B operation.

*Figure 1* depicts the proposed STA 0.5 mV/m, the previously authorized STA 0.5 mV/m at the WGNU site and the licensed KXEN 0.5 mV/m contours. The proposed STA 0.5 mV/m contour lies well within the licensed 0.5 mV/m in the major lobe. *Figure 2* depicts the day allocation to nearby stations for both licensed, previously authorized STA at the site of WGNU(AM) and the STA operations proposed herein. The licensed KXEN facility is associated with grandfathered caused overlap to WPEO 1020 kHz Peoria, IL. The proposed STA facility removes that overlap. The licensed facility contour overlap with WCIL 1020 kHz, Carbondale, IL increases the overlap to WCIL from 3,195 square kilometers to 3,865 square kilometers which for short term STA operation appears an equitable trade off against the massive loss of KXEN service area given that most receivers have such a narrow bandwidth that the interference change from KXEN license to KXEN STA operation would not be readily discerned by the average listener. The STA is associated with no caused co-channel overlap.
