ENGINEERING STATEMENT

Of

Lee S. Reynolds

And

Virgle Leon Strickland

In Support of an Application

for a Minor Modification

of a FM Auxiliary

Construction Permit

WYSF

Birmingham, Alabama

Channel 233 – 94.5 MHz

ERP: 50.0 kW(H&V)

January, 2007

General

As broadcast technical consultants doing business as Reynolds Technical Associates (RTA), we have been authorized by Citadel Broadcasting Company (herein referred to as “The Applicant”), to conduct engineering studies and prepare the engineering portion of an application to modify a construction permit for an auxiliary facility of WYSF (File number BXPB-20061220AAH). The applicant is seeking to reduce the authorized effective radiated power from 100 kilowatts to 50 kilowatts. All other operating parameters will remain the same.

WYSF's licensee is the same entity filing the instant FM auxiliary application.

The following engineering studies and exhibits support the instant application study results.

The Proposed Site
(Exhibit E, Figure 1)

Exhibit E, Figure 1 is a vertical sketch of the existing antenna supporting structure with pertinent proposed elevations. The antenna structure registration number for the existing tower is 1017640.

There are no proposed or authorized FM or TV transmitters that may produce receiver-induced interference within ten (10) kilometers of the proposed.

Surrounding Terrain and Predicted Contours
(Exhibit E, Figures 2 through 4)

Exhibit E, Figure 2 is a terrain averaging and service contour study showing the FCC F(50/50) 60 dBu contour of the proposed FM auxiliary.

Exhibit E, Figure 3 is a terrain averaging and service contour study showing the FCC F(50/50) 60 dBu contour of the licensed main facilities. The resulting contours for the proposed auxiliary facility and the main facility are shown in map form as Exhibit E, Figure 4.

The distance to the blanketing contour is calculated to be 2.78 kilometer (1.73 mile).

Human Exposure
(Exhibit E, Figure 5)

The proposed FM facility was evaluated in terms of potential radiofrequency radiation exposure at ground level in accordance with the RF Worksheet #1 [FCC 301 Worksheet 7 (Page 4 and 5)].

Exhibit E, Figure 5 is results of the evaluation considering all facilities (including the proposed facilities)

Should anyone be required to climb the tower, the policy is to either reduce power or cease operation, so as to prevent hazardous exposure to radiofrequency radiation.

Environmental Impact
(No Exhibits)

A grant of the proposed construction would not constitute a major action as defined in the Commission's Rules and Regulations.

During operation, the facility will produce no chemical or significant thermal pollution, and no ionizing radiation will be generated. Areas of high intensity radiofrequency fields will be confined to the immediate area of the transmitting antenna, far above the ground and away from any human and wildlife population.

The area is not officially designated as a wilderness area or wildlife preserve and is not pending consideration. The area has no significant value in American history, architecture, archaeology, or culture, which is listed in the Register of Historic Places, and it is not eligible for listing. It is not recognized either nationally or locally for special scenic or recreational value.

Conclusion

This statement/application has been prepared for The Applicant by utilizing the latest available information, cross-checked with the Federal Communications Commission and other sources. Therefore, it is submitted that the engineering data compiled and demonstrated herein for the proposed is in compliance with Commission's Rules and Regulations at the time of this application's filing date. We welcome the opportunity to discuss with the staff of the Federal Communications Commission the engineering data contained in this application. Should any questions arise concerning the information, please contact us.

Statement of the Consultants

The instant engineering statement was prepared for The Applicant and supports an application for a minor modification of a construction permit for a FM Auxiliary for WYSF, Birmingham, Alabama. It was developed by RTA and may not be used for purposes other than submission to the Commission by the applicant.

It may not be reproduced in its entirety, or in part, by anyone (other than from the Commission) without the written consent of RTA.

It is prepared for The Applicant under contractual agreement, and its certification by RTA is used accordingly. If The Applicant fails in its contractual obligation, RTA reserves the right to withdraw its certification.

The information in this application is compiled from the most recent Commission and outside data. RTA is not responsible for errors resulting from incorrect data or unpublished rule and procedure changes.

For RTA:

A handwritten signature in black ink that reads "Lee S. Reynolds". The signature is written in a cursive style and is positioned above a horizontal line.

Engineering Statement
Application for a Construction Permit
WYSF(FM) Auxiliary, 94.5 MHz., Birmingham, Alabama

Proposed Location - 33° 27' 45" N. Lat. 86° 50' 59" W. Long. [NAD 27]

NOT DRAWN TO SCALE

ASRN: 1017640

Proposed antenna: 4 element, ERI

Note 1: The main antenna for WYSF is used as a common antenna with WZRR and is mounted at 204 meters above ground level.

Note 2: WZRR is proposing to mount an auxiliary at 152.3 meters above ground level.

Human Exposure to Radiofrequency Radiation Study

WYSF and WZRR main facilities use an ERI G5CPS-8BC (full wave spaced) 8 bay antenna as a common antenna mounted 204 meters above ground level. Each operates with 100 kilowatts (horizontally & vertically). WYSF is proposing to use a 4 bay ERI antenna (full wave spaced) to be mounted 170 meters above ground with 50 kilowatts (horizontally & vertically) as an auxiliary antenna. WZRR is proposing to use a 4 bay ERI antenna (full wave spaced) to be mounted 152 meters above ground with 50 kilowatts (horizontally & vertically) as an auxiliary antenna. The power densities of this evaluation for all of the WYSF & WZRR facilities were base on FM Model (V2.10b) by using the ERI or Jampro JBCP “Rototiller” (EPA) antenna.

WBHJ is located 320 meters away from the base of the structure of WYSF. WBHJ uses Dielectric DCPJ 2 section (full wave spaced) antenna, mounted 200 meters above ground level with 12.2 kilowatts (horizontally & vertically). The power density was calculated considering a conservative downward relative field value of 0.5.

<u>CALL</u>	<u>Service</u>	<u>Channel</u>	<u>Freq.</u>	<u>Polari- zation</u>	<u>Antenna Height* (AGL)</u>	<u>ERP (kW)</u>	<u>Relative Field Factor</u>	<u>Vertical Predicted Power Density (mW/cm²)</u>	<u>FCC Uncontrolled Limit (mW/cm²)</u>	<u>Percent of Uncontrolled Limit</u>
WYSF	FS	233	94.5	H&V	170	50.000	1.000	0.0102676	0.200	5.1338%
WYSF	FM	233	94.5	H&V	204	100.000	1.000	0.0095513	0.200	4.7757%

WZRR	FS	258	99.5	H&V	152	50.000	1.000	0.0128796	0.200	6.4398%
WZRR	FM	258	99.5	H&V	204	100.000	1.000	0.0095513	0.200	4.7757%

Total Percentage of ANSI (uncontrolled) value = 23.88%

* The antenna height indicated above is 2 meters less than the actual antenna height so that the predicted power density consider the 2 meter human height allowance.

WYSF auxiliary facility will produce a power density of 10.27 μW/cm² at 68.8 meters from the base of the tower. At 2 meters from the base of the tower, the power density would be 3.55 μW/cm². The highest number is used for this study.

WYSF main facility will produce a power density of 9.55 μW/cm² at 54.6 meters from the base of the tower. At 2 meters from the base of the tower, the power density would be 4.9 μW/cm². The highest number is used for this study.

WBHJ facility will produce a power density of 5.5 μW/cm² 2 meters from the base of the tower.

WZRR auxiliary facility will produce a power density of 12.88 μW/cm² at 68.8 meters from the base of the tower. At 2 meters from the base of the tower, the power density would be 4.45 μW/cm². The highest number is used for this study.

WZRR main facility will produce a power density of 9.55 μW/cm² at 54.6 meters from the base of the tower. At 2 meters from the base of the tower, the power density would be 4.9 μW/cm². The highest number is used for this study.

Although all facilities will not be radiating simultaneously, they were considered to be so for this study. The results of the study demonstrates that the power density is 23.9% of the limit for “uncontrolled” environments and 4.8% of the limit for “controlled” environments.
