Technical Narrative

The technical exhibit of which this narrative is part has been prepared on behalf of Pilgrim Communications, Inc., licensee of AM broadcast station KRCN at Longmont, Colorado. KRCN is licensed as a Class D station for operation on 1060 kilohertz with daytime power of 50 kilowatts and secondary nighttime power of 111 watts, operating with the different non-directional antenna during daytime and nighttime hours. By means of this present application, the licensee proposes to change the nighttime transmitter site location using an existing tower for non-directional secondary nighttime operation. The daytime and nighttime services will continue to operate from different site locations.

The proposal is classified as a minor change according to 47 CFR 73.3571(a)(2). As a Class D station operating on one of the channels listed in 73.25(b), the proposal satisfies 47 CFR 73.21(a)(3) which permits operation with a nominal power of less than 0.25 kilowatt and an equivalent RMS antenna field of less than 141 mV/m at on km. The Federal Aviation Administration has not been notified of the proposal as new tower construction is not proposed.

Proposed Transmitter Location

The location of the proposed KRCN nighttime facility will be located with an existing tower and is at NAD27 coordinates:

40-11-26 North

105-07-37 West

The proposed transmitter site is shown on Figure 1 while the antenna site plat is shown on Figure 2.

Non-Directional Antenna System

An existing tower used for cellular communication is proposed for the secondary nighttime non-directional operation. As indicated on Figure 3, the radiating element for the tower is 57.9 meters in height (73.7 electrical degrees) and has an overall height of 58.8 meters above ground level. The ASR Registration Number is: 1228514.

Antenna Feed System

As shown on Figure 3, a single slant-wire feed system is proposed to deliver power to the existing grounded tower. The feed wire begins at ground level with a distance of 32 feet from the center-line of the self-supported tower. The face width at the bottom of the tower is 9 feet. The feed-wire slopes upwards to attach to the tower at a point 71 feet above ground level.

The proposed feed system is very appropriate for exciting towers on which multiple antennas have been mounted. The single feed wire attaches to the

tower generally below the level of cellular or other type of antennas. Whereas the typical folded unipole antenna has three or six wires covering most of the tower heights, which tends to obstruct the cellular antennas and has a potential for hazard for workers.

Nighttime Allocation Study

The proposed KRCN facility will afford nighttime protection to all stations and international allotments operating on 1050 kHz, 1060 kHz, and 1070 kHz. As the slant-wire feed system represents a non-standard but technically acceptable approach to feeding a non-directional antenna, a study utilizing a multi-step methodology has been employed to ensure the nighttime interference protection requirements are met as outlined in the Rules.

Step 1

A standard nighttime allocation study was performed assuming the proposed tower to be series fed at the proposed physical height of 190 feet. As shown on Figure 4, a power level of 114 watts would be allowable under these assumed conditions. It can be noted that the relevant elevation angles to protect all stations in the study vary between 0 and 26.2 degrees.

Step 2

A computer model of the proposed antenna with the slant-fed arrangement was developed to run with the numerical electromagnetic code, NEC4. Figure 3 shows the exact plan view of the model as captured from the NEC4 software. Figure 5 shows the NEC4 input file used to generate the study results.

For the study, a vertical radiation pattern was generated every 5 degrees in azimuth to determine the pattern characteristics to be compared with the FCC

form factor over the relevant elevation angles. An elevation angle range of 0 to 30 degrees with data generated every 5 degrees was selected for the analysis. Figure 6 shows a tabulation showing the results of this study. As can be seen from Figure 6, a maximum percent difference from the FCC form factor for the proposed antenna height is 0.7 percent.

Step 3

The maximum percent difference of 0.7 percent, as determined in Step 3, is applied to the standard permissible power level of 114 watts, as calculated in Step 1. The acceptable power level to ensure that this particular proposed slant-fed antenna meets the nighttime interference protection requirements as outlined in the Rules is 112 watts. $[112 = 114 * (1 - 0.007)^2]$

Using an analysis that utilizes the industry standard numerical electromagnetic code, NEC4, shows a shunt-fed antenna of the proposed configuration to be only a fraction of a percent different from the standard FCC form factor as defined in Section 73.160 over the span of elevation angles particular to this allocation situation. Further study of shunt-fed antennas using NEC4 reveals that for higher elevation angles(above 30 degrees) and for taller tower heights(above 90 degrees) that an increasingly significant percent difference from the FCC form factor will result. Therefore, it is necessary to model each unique slant-fed antenna to determine compliance with the FCC Rules.

Environmental Considerations

The proposed KRCN operation was evaluated in terms of both the electric and magnetic field components which will be present at the base of the tower. Using Figures 1 through 4 of Supplement A to OET Bulletin 65, the worst case interpolated distance at which the electric and magnetic fields would fall below ANSI guidelines is 2 meters. Accordingly, the areas surrounding the base of the tower and slant-wire feed will be appropriately restricted with fences having a minimum radius of 2 meters (7 feet) unless data obtained after construction has been completed indicates otherwise. The fences will assure that persons on the property outside the fenced area will not be exposed to radiofrequency field levels in excess of those recommended by the ANSI. In addition, warning signs will be posted.

This statement addresses only human exposure to radiofrequency radiation and not to other non-radiofrequency radiation matters listed in the National Environmental Policy Act of 1969.
